1 ICON Namelists

1.1 Scripts, Namelist files and Programs

Run scripts starting the programs for the models are stored in run/. These scripts write namelist files containing the specified Fortran namelists. Programs are stored in < icon home>/build< architecture>/bin/.

Tabelle 1: Namelist files

| Namelist file | Purpose | Made by script | Used by program |
|------------------|---------------------|----------------------------------|--|
| NAMELIST_GRAPH | Generate graphs | ${ m create_global_grids.run}$ | $\operatorname{grid} _\operatorname{command}$ |
| $NAMELIST_GRID$ | Generate grids | $create_global_grids.run$ | $\operatorname{grid} _\operatorname{command}$ |
| NAMELIST_GRIDREF | Gen. nested domains | $create_global_grids.run$ | $\operatorname{grid} _\operatorname{command}$ |
| NAMELIST_ICON | Run ICON models | exp. <name>.run</name> | $\frac{1}{1}$ control_model |

1.2 Namelist parameters

The following subsections tabulate all available Fortran namelist parameters by name, type, default value, unit, description, and scope:

- Type refers to the type of the Fortran variable, in which the value is stored: I=INTEGER, L=LOGICAL, R=REAL, C=character string
- Default is the preset value, if defined, that is assigned to this parameter within the programs.
- *Unit* shows the unit of the control parameter, where applicable.
- Description explains in a few words the purpose of the parameter.
- Scope explains under which conditions the namelist parameter has any effect, if its scope is restricted to specific settings of other namelist parameters.

Information on the file, where the namelist is defined and used, is given at the end of each table.

2 Namelist parameters defining the atmospheric model

Namelist parameters for the ICON models are organized in several thematic Fortran namelists controling the experiment, and the properties of dynamics, transport, physics etc.

$2.1\ assimilation_nml$

The main switch for the Latent heat nudging scheme is called ldass_lhn and has to be set in run_nml.

| Parameter | Type | Default | Unit | Description | Scope |
|------------------|------|-----------|-----------------|--|---|
| nlhn_start | I | -9999 | S | time in seconds when LHN is applied for the | $run_nml:ldass_lhn = .true.$ |
| | | | | first time | |
| $nlhn_end$ | I | -9999 | S | time in seconds when LHN is applied for the | $\mid \text{run_nml:ldass_lhn} = . \text{true.} \mid$ |
| | | | | last time | |
| lhn_coef | R | 1.0 | | Nudging coefficient of adding the increments | |
| fac_lhn_up | R | 2.0 | | Upper limit of the scaling factor of the | |
| | | | | temperature profile. | |
| fac_lhn_down | R | 0.5 | | Lower limit of the scaling factor of the | |
| | | | | temperature profile. | |
| lhn_logscale | L | .TRUE. | | Apply all scaling factors as logarithmic | fac_lhn_down, fac_lhn_up, |
| | | | | values | fac_lhn_artif |
| $thres_lhn$ | R | 0.1/3600. | $\mathrm{mm/s}$ | Minimal value of precipitation rate, either of | |
| | | | | model or radar. LHN will be applied first for | |
| | | | | precipitation above it. | |
| $start_fadeout$ | R | 1.0 | | Value to determine, at which model time | |
| | | | | step a fading out of the increments might | |
| | | | | start. | |

| Parameter | Type | Default | Unit | Description | Scope |
|------------------|------|-----------|----------------------------|--|---|
| lhn_qrs | L | .TRUE. | | Use a vertical average of precipitation fluxes as reference to compare with radar observed precipitation, to avoid severe overestimation | |
| rqrsgmax | R | 1.0 | | due to displacement of model surface precipitation. If set .FALSE. the model surface precipitation rate is used as reference. This value determines the height of the vertical averaging, to obtain the reference precipitation rate It is the model layer where the quotion of the maximal precipitation flux occurred for the first time. | $lhn_qrs = .TRUE.$ |
| lhn_hum_adj | L | .TRUE. | | Apply an increment of specific humidity with respect to the estimated temperature increment to maintain the relative humidity | |
| lhn_no_ttend | L | .FALSE. | | Only apply moisture increments. Temperature increments will only be used for calculation of moisture increments | lhn_hum_adj=.TRUE. |
| $lhn_incloud$ | L | .TRUE. | | Apply increments only in model layers where the underlying latent heat release of the model is positive. | lhn_artif_only=.FALSE. |
| lhn limit | L | .TRUE. | | Limitation of temperature increments | abs lhn lim |
| abs_lhn_lim | R | 50./3600. | m K/s | Lower and upper limit for temperature increments to be added. | lhn_limit = .TRUE. |
| ${ m lhn_filt}$ | L | .TRUE. | | Vertical smoothing of the profile of temperature increments | |
| ho = ho relax | L | .FALSE. | | Horizontal smoothing of radar data but also of incorporated model fields | nlhn_relax |
| nlhn_relax | I | 2 | $rac{ m grid}{ m points}$ | Number of horizontal grid point, where smoothing is applied. | $lhn_{relax} = .TRUE.$ |
| lhn_wweight | L | .FALSE. | | Reduction of the LHN temperature increment in case of strong advection, messured by horizontal wind in 950, 850 and 700 hPa. The reduction is done linearly down to cero. | |
| lhn_artif | L | .TRUE. | | Apply an artificial temperature profile to estimate increments at model grid points without significant precipitation (determined by fac_lhn_artif). | fac_lhn_artif, tt_artif_max, zlev_artif_max, std_artif_ma |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------|----------|--------------------|------|---|------------------------------|
| fac_lhn_artif | R | 5.0 | | Value of the ratio of radar to model | lhn_artif=.TRUE. |
| | | | | precipitation rate, from which an artificial | |
| | | | | temperature profile is applied | |
| $fac_lhn_artif_tune$ | R | 1.0 | | Tuning factor to optimize the effectiveness of | lhn_artif=.TRUE. |
| | | | | the artificial profile. | |
| lhn artif only | L | .FALSE. | | Scaling the artificial temperature profile | tt artif max, |
| | | | | instead of local model profile of latent heat | zlev artif max, |
| | | | | release for calculation the increments at any | std artif max |
| | | | | model grid point. | |
| | | | | The scaling factor is still be determined by | |
| | | | | the ratio of observed to modelled | |
| | | | | precipitation rate. | |
| tt artif max | R | 0.0015 | K | Maximal temperature of Gaussian shaped | lhn artif, lhn artif only |
| | | | | function used a artificial temperature profile. | |
| zlev_artif_max | R | 1000.0 | m | Height of maximum of Gaussian shaped | lhn artif, lhn artif only |
| | | | | function used a artificial temperature profile. | |
| std artif max | R | 4.0 | m | Parameter defining width of Gaussian | lhn artif, lhn artif only |
| | | | | shaped function used a artificial temperature | _ |
| | | | | profile. | |
| nlhnverif start | I | -9999 | s | time in seconds when online verification | run nml: ldass lhn = .true. |
| | | | _ | within LHN is active for the first time | |
| nlhnverif end | I | -9999 | s | time in seconds when online verification | $run_nml:ldass_lhn = .true.$ |
| | | | _ | within LHN is active for the last time | |
| lhn_diag | \mid L | .FALSE. | | Enable a extensive diagnostic output, | |
| | | | | writing into file lhn.log. | |
| | | | | lhn diag is set .TRUE. automatically, when | |
| | | | | online verification is active. | |
| lhn dt obs | R | 300.0 | s | Frequency of the radar observations | |
| radar in | C | , /, | | Path where the radar data file is expected. | |
| radardata file(:) | C | - / | | Name of the radar data file. This might be | |
| (') | (n dom) | | | either in GRIB2 or in NetCDF | |
| | (| | | (recommended). | |
| lhn black | L | .FALSE. | | Apply a blacklist information in the radar | |
| _ 516661 | | 11112021 | | data obtained by comparison against satelite | |
| | | | | clound information | |
| blacklist file(:) | \mid C | 'radarblacklist.nc | | Name of blacklist file, containing a mask | lhn black=.TRUE. |
| · (· / | (n dom) | | | concerning the quality of the radar data. | |
| | ("_" | | | Value 1: good quality | |
| | | | | Value 0: bad quality | |
| | | | | This might be either in GRIB2 or in | |
| | | | | NetCDF (recommended). | |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------|---------|------------------|------|---|-------------------|
| lhn_bright | L | .FALSE. | | Apply a model intern bright band detection | |
| | | | | to avoid strong overestimation due to | |
| | | | | uncertain radar observations. | |
| height_file(:) | C | 'radarheight.nc' | | Name of file containing the height of the | lhn_bright=.TRUE. |
| | (n_dom) | | | lowest scan for each possible radar station | |
| | | | | within the given radar composite. | |
| | | | | This file is required, when applying bright | |
| | | | | band detection. | |
| | | | | This might be either in GRIB2 or in | |
| | | | | NetCDF (recommended). | |
| nradar | I | 20 | | Maximal number of radar height layers | lhn_bright=.TRUE. |
| | (n_dom) | | | contained within height_file | |

Defined and used in: src/namelists/mo_assimilation_nml.f90

2.2 ccycle_nml

The coupling of the carbon cycle between the atmosphere and land ocean is configured by the data structure $ccycle_config(jg=1:ndom)\% < param>$, which is a 1-dimensional array extending over all domains.

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------------------|------|---------|------|--|-------------------------------------|
| ccycle_config(jg)% iccycle | I | 0 | | controls the carbon cycle mode: | $echam_phy_config(jg)\%$ |
| | | | | 0: no C-cycle | $ m dt_vdf > 0.000s ~and$ |
| | | | | 1: C-cycle with interactive atmospheric CO_2 | $echam_phy_config(jg)\%$ |
| | | | | concentration | ljsb = .TRUE. (and |
| | | | | 2: C-cycle with prescribed atmospheric CO_2 | atmosphere is coupled to |
| | | | | concentration | ocean with biogeochemistry) |
| $ccycle_config(jg)\%$ $ico2conc$ | I | 2 | | controls the CO_2 concentration provided to | $ccycle_config(jg)\%$ $iccycle = $ |
| | | | | land/JSBACH and - if coupled to the ocean | 2 |
| | | | | - to the ocean/HAMOCC | |
| | | | | 2: constant concentration as defined by | |
| | | | | ccycle_config(jg)% vmr_co2 | |
| | | | | 4: transient concentration scenario from file | |
| | | | | bc_greenhouse_gases.nc | |
| ccycle_config(jg)% vmr_co2 | R | 284.32 | ppmv | constant CO_2 volume mixing ratio of 1850 | $ccycle_config(jg)\%$ $ico2conc$ |
| | | | | (CMIP6) | = 2 |

2.3 coupling_mode_nml

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------|---------|------|---|-------|
| coupled_mode | L | .FALSE. | | .TRUE.: if yac coupling routines have to be | |
| | | | | called | |

Defined and used in: src/namelists/mo_coupling_nml.f90

2.4 diffusion_nml

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------|------------------|---------|------|--|------------------------------------|
| lhdiff_temp | L | .TRUE. | | Diffusion on the temperature field | |
| lhdiff_vn | L | .TRUE. | | Diffusion on the horizontal wind field | |
| lhdiff_w | L | .TRUE. | | Diffusion on the vertical wind field | |
| hdiff_order | I | 5 | | Order of ∇ operator for diffusion: | |
| | | | | -1: no diffusion | |
| | | | | 2: ∇^2 diffusion | |
| | | | | 3: Smagorinsky ∇^2 diffusion (requires | |
| | | | | $\operatorname{lhdiff_rcf} = \operatorname{.TRUE.}$ | |
| | | | | $4: \nabla^4 \text{ diffusion}$ | |
| | | | | 5: Smagorinsky ∇^2 diffusion combined with | |
| | | | | $ abla^4$ background diffusion as specified via | |
| | | | | hdiff_efdt_ratio | |
| $ ho lsmag_3d$ | L | .FALSE. | | .TRUE.: Use 3D Smagorinsky formulation | hdiff_order=3 or 5; |
| | | | | for computing the horizontal diffusion | itype_vn_diffu=1 |
| | | | | coefficient (recommended at mesh sizes finer | |
| | | | | than 1 km if the LES turbulence scheme is | |
| 11.00 | _ | | | not used) | |
| itype_vn_diffu | I | 1 | | Reconstruction method used for | iequations=3, hdiff_order=3 |
| | | | | Smagorinsky diffusion: | or 5 |
| | | | | 1: u/v reconstruction at vertices only | |
| :4 4 1:00 | т | 0 | | 2: u/v reconstruction at cells and vertices | : |
| $itype_t_diffu$ | I | 2 | | Discretization of temperature diffusion: 1: $K_h \nabla^2 T$ | iequations=3, hdiff_order=3 or 5 |
| | | | | $\begin{array}{c} 1 \cdot K_h \vee I \\ 2 \cdot \nabla \cdot (K_h \nabla T) \end{array}$ | 01.5 |
| hdiff efdt ratio | $ _{\mathrm{R}}$ | 36.0 | | ratio of e-folding time to time step (or 2^* | |
| ndin_eidt_iatio | 10 | 30.0 | | time step when using a 3 time level time | |
| | | | | stepping scheme) (for triangular NH model, | |
| | | | | values above 30 are recommended when | |
| | | | | using hdiff order=5) | |
| hdiff w efdt ratio | R | 15.0 | | ratio of e-folding time to time step for | iequations=3 |
| | | | | diffusion on vertical wind speed | 1 |
| | 1 | I | l | | 1 |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------|----------|-----------------------|------|---|--------------------|
| hdiff min efdt ratio | R | 1.0 | | minimum value of hdiff_efdt_ratio near | iequations=3 .AND. |
| | | | | model top | $hdiff_order=4$ |
| hdiff tv ratio | R | 1.0 | | Ratio of diffusion coefficients for | |
| | | | | temperature and normal wind: $T: v_n$ | |
| hdiff multfac | R | 1.0 | | Multiplication factor of normalized diffusion | n dom>1 |
| _ | | | | coefficient for nested domains | |
| hdiff smag faci | R | 0.015 | | Scaling factor for Smagorinsky diffusion at | iequations=3 |
| | | | | height $hdiff_smag_z$ and below. | |
| | | | | $hdiff\ smag\ fac \geq 0.$ | |
| hdiff smag fac2 | R | $2 \cdot 10^{-6}$ · | | Scaling factor for Smagorinsky diffusion at | iequations=3 |
| | | (1600 + 25000 + | | height $hdiff smag z2$. | _ |
| | | $(1600 \cdot (1600 +$ | | $hdiff\ smag\ fac2 \geq 0$. Between | |
| | | 50000))) ≈ | | hdiff smag z and $hdiff smag z2$ the | |
| | | 0.071 | | scaling factor changes linearly from | |
| | | | | hdiff smag fac to hdiff smag fac2. | |
| hdiff smag fac3 | R | 0. | | Scaling factor for Smagorinsky diffusion at | iequations=3 |
| _ | | | | height $hdiff smag z3$. | |
| | | | | $hdiff_smag_fac3 \ge 0$. The three points | |
| | | | | $(hdiff\ smag\ z2, hdiff\ smag\ fac2),$ | |
| | | | | harpoonup (hdiff smag z3, hdiff smag fac3), and | |
| | | | | $(hdiff_smag_z4, hdiff_smag_fac4)$ | |
| | | | | determine the quadratic function for the | |
| | | | | scaling factor between $hdiff smag z2$ and | |
| | | | | hdiff smag z4. | |
| hdiff smag fac4 | R | 1.0 | | Scaling factor for Smagorinsky diffusion at | iequations=3 |
| _ | | | | height $hdiff smag z4$ and higher. | |
| | | | | $hdiff \ smag \ fac4 \ge 0.$ | |
| hdiff smag z | \mid R | 32500. | m | Height up to which hdiff smag fac is | iequations=3 |
| _ | | | | used, and where the linear profile up to | |
| | | | | height $hdiff smag z2$ starts. | |
| hdiff smag z2 | R | 1600 + 50000 + | m | Height with scaling factor | iequations=3 |
| _ | | $(1600 \cdot (1600 +$ | | hdiff smag fac2 where the linear profile | _ |
| | | 50000) | | starting at $hdiff$ smag z ends, and where | |
| | | 60686 | | the quadratic profile up to $hdiff$ $smag$ $z4$ | |
| | | | | starts. $hdiff smag z <$ | |
| | | | | $hdiff \ smag \ z2 < hdiff \ smag \ z4.$ | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------|------|---------|------|--|--------------|
| hdiff smag z3 | R | 50000. | m | Height with scaling factor | iequations=3 |
| | | | | $hdiff_smag_fac$ 3. Needed to determine | |
| | | | | the quadratic function between | |
| | | | | $hdiff_smag_z2$ and $hdiff_smag_z4$. | |
| | | | | $hdiff_smag_z3 \neq hdiff_smag_z2 \land$ | |
| | | | | $hdiff_smag_z3 \neq hdiff_smag_z4.$ | |
| hdiff smag z4 | R | 90000. | m | Height from which $hdiff_smag_fac4$ is | iequations=3 |
| | | | | used. $hdiff_smag_z4 > hdiff_smag_z2$. | |

Defined and used in: src/namelists/mo_diffusion_nml.f90

2.5 dynamics_nml

This namelist is relevant if run_nml:ldynamics=.TRUE.

| Parameter | Type | Default | Unit | Description | Scope |
|----------------|------|---------|------|---|-----------------------------------|
| iequations | I | 3 | | Equations and prognostic variables. Use | |
| | | | | positive indices for the atmosphere and | |
| | | | | negative indices for the ocean. | |
| | | | | 3: non-hydrostatic atmosphere | |
| | | | | -1: hydrostatic ocean | |
| idiv method | I | 1 | | Method for divergence computation: | |
| _ | | | | 1: Standard Gaussian integral. | |
| | | | | Hydrostatic atm. model: for unaveraged | |
| | | | | normal components | |
| | | | | Non-hydrostatic atm. model: for averaged | |
| | | | | normal components | |
| | | | | 2: bilinear averaging of divergence | |
| divavg_cntrwgt | R | 0.5 | | Weight of central cell for divergence | $ \ \mathrm{idiv_method} = 2$ |
| | | | | averaging | |
| lcoriolis | L | .TRUE. | | Coriolis force | |
| ldeepatmo | L | .FALSE. | | Switch for deep-atmosphere modification of | iequations = 3 |
| | | | | non-hydrostatic atmosphere. Specific settings | $ 	ext{ iforcing} = 0, 2, 3$ |
| | | | | can be found in upatmo_nml. | $is_plane_{torus} = .FALSE.$ |

Defined and used in: src/namelists/mo_dynamics_nml.f90

2.6 echam_cld_nml

The parameterization of cloud microphysics for the ECHAM physics is configured by a data structure $echam_cld_config(jg=1:ndom)\% < param>$, which is a 1-dimensional array extending over all domains. The structure contains parameters providing control over the parametrized effects:

2.11 echam phy nml

The ECHAM physics is configured by a data structure $echam_phy_config(jg=1:ndom)\% < param>$, which is a 1-dimensional array extending over all domains. The structure contains several parameters providing time control for the atmospheric forcing by the different parameterizations. Further logical switches control how the atmospheric boundary conditions for the ECHAM physics are determined. Time control parameters are available for the atmospheric processes tabulated below.

| prc | $parameterized\ process$ |
|----------------------|--|
| rad | LW and SW radiation |
| vdf | vertical diffusion |
| cnv | cumulus convection |
| cld | cloud microphysics |
| gwd | atmospheric gravity wave drag |
| SSO | sub grid scale orographic effects |
| mox | methane oxidation and water vapor photolysis |
| car | Cariolle's linearized ozone chemistry |
| art | ART chemistry |

The time control for an atmospheric forcing by a process prc consists of three components, the time interval dt_prc for re-computing the forcing, and the start and end dates and times defining the interval $[sd_prc, ed_prc]$, in which the forcing is either computed, if the date/time coincides with the interval dt_prc , or recycled. Recycling means that the forcing stored from the last computation is used again. Outside of the interval the forcing is set to zero.

If dt_prc is not specified, or an empty string or a string of blanks or an interval of length 0s, e.g. "PT0S" is given, then the forcing is switched off for the entire experiment and the start and end dates and times are irrelevant.

If sd_prc or ed_prc are not specified, or an empty string or a string of blanks are given, then the experiment start date and the experiment stop date are used, respectively.

Further the forcing control switch fc_prc can be used to decide if an active process $(dt_prc > 0)$ is used for the integration $(fc_prc = 1)$ or only computed for diagnostic purposes $(fc_prc = 0)$.

| Parameter | Type | Default | Unit | Description | Scope |
|------------------------------|------|---------|-----------------------|--|------------------------------|
| echam_phy_config(jg)% dt_prc | C | | | This is the time interval in ISO 8601-2004 | ${ m run_nml/iforcing} = 2$ |

2.18 grid_nml

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------|------|---------|-------|--|-----------------------|
| lplane | L | .FALSE. | | planar option | |
| is_plane_torus | L | .FALSE. | | f-plane approximation on triangular grid | |
| corio_lat | R | 0.0 | deg | Center of the f-plane is located at this | lplane=.TRUE. and |
| | | | | geographical latitude | is_plane_torus=.TRUE. |
| grid_angular_velocity | R | Earth's | rad/s | The angular velocity in rad per sec. | |
| l scm mode | L | .FALSE. | | Single Column Model (SCM) mode. Can be | is_plane_torus=.TRUE. |
| | | | | extended to equivalent LES and CRM setups | |
| | | | | by setting ldynamics=.TRUE | |
| l limited area | L | .FALSE. | | | |
| grid_rescale_factor | R | 1.0 | | Defined as the inverse of the reduced-size | |
| | | | | earth reduction factor X . Choose | |
| | | | | grid_rescale_factor < 1 for a | |
| | | | | reduced-size earth. | |
| | | | | | |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------|-------------|---------|------|---|---------|
| lrescale_timestep | L | .FALSE. | | if .TRUE. then the timestep will be multiplied by grid_rescale_factor. | |
| $lrescale_ang_vel$ | L | .FALSE. | | if .TRUE. then the angular velocity will be divided by grid_rescale_factor. | |
| lfeedback | L(n_dom) | .TRUE. | | Specifies if feedback to parent grid is performed. Setting lfeedback(1)=.false. turns off feedback for all nested domains; to turn off feedback for selected nested domains, set lfeedback(1)=.true. and set ".false." for the desired model domains | n_dom>1 |
| $ifeed back_type$ | I | 2 | | 1: incremental feedback 2: relaxation-based feedback Note: vertical nesting requires option 2 to run numerically stable over longer time periods | n_dom>1 |
| ${ m start_time}$ | R(n_dom) | 0. | S | Time when a nested domain starts to be active. Relative time w.r.t. experiment start date (ini_datetime_string / experimentStratDate). (namelist entry is ignored for the global domain) | n_dom>1 |
| ${ m end_time}$ | R(n_dom) | 1.E30 | S | Time when a nested domain terminates. Relative time w.r.t. experiment start date (ini_datetime_string / experimentStratDate). (namelist entry is ignored for the global domain) | n_dom>1 |
| patch_weight | $R(n_dom)$ | 0. | | If patch_weight is set to a value > 0 for any of the first level child patches, processor splitting will be performed, i.e. every of the first level child patches gets a subset of the total number or processors corresponding to its patch_weight. A value of 0. corresponds to exactly 1 processor for this patch, regardless of the total number of processors. For the root patch and higher level childs, patch_weight is not used. However, patch_weight must be set to 0 for these patches to avoid confusion. | n_dom>1 |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------------------|----------|---------|------|---|---------------------------|
| lredgrid_phys | L(n_dom) | .FALSE. | | If set to .true. radiation is calculated on a reduced grid (= one grid level higher) Needs to be set for each model domain separately; for the global domain, the file containing the reduced grid must be specified | |
| dynamics_grid_ filename | C | | | in the variable "radiation_grid_filename" Array of the grid filenames to be used by the dycore. May contain the keyword <path> which will be substituted by model_base_dir.</path> | |
| dynamics_parent_ grid_id | I(n_dom) | i-1 | | Array of the indexes of the parent grid filenames, as described by the dynamics_grid_filename array. Indexes start at 1, an index of 0 indicates no parent. Specification of this namelist parameter is only required if more than one domain is in use and the grid files are rather old s.t. they do not contain a uuidOfParHGrid global attribute. | |
| radiation_grid_ filename | С | | | Grid filename to be used for the radiation model on the coarsest grid. Filled only if the radiation grid is different from the dycore grid. May contain the keyword <path> which will be substituted by model_base_dir.</path> | $lredgrid_phys{=}.TRUE.$ |
| create_vgrid | L | .FALSE. | | .TRUE.: Write vertical grid files containing (vct_a, vct_b, z_ifc, and z_ifv. | |
| vertical_grid_filename | C(n_dom) | | | Array of filenames. These files contain the vertical grid definition (vct_a, vct_b, z_ifc). If empty, the vertical grid is created within ICON during the setup phase. | |
| use_duplicated_ connectivity | L | .TRUE. | | if .TRUE., the zero connectivity is replaced by the last non-zero value | |
| use_dummy_cell_closure | L | .FALSE. | | if .TRUE. then create a dummy cell and connect it to cells and edges with no neighbor | |

| two iou wat | I | 1 | | Weighting function for performing IAU | init mode=5,6 |
| type_iau_wgt | 1 | 1 | | 1: Top-Hat | mt_mode=5,0 |
| | | | | 2: SIN2 | |
| nlevsoil in | I | 4 | | number of soil levels of input data | init mode=2 |
| zpbl1 | R | 500.0 | m | bottom height (AGL) of layer used for | Int_mode=2 |
| Zpori | | 000.0 | 111 | gradient computation | |
| zpbl2 | R | 1000.0 | m | top height (AGL) of layer used for gradient | |
| _F | | | | computation | |
| lread ana | \mid L | .TRUE. | | If .FALSE., ICON is started from first guess | init mode=1,3 |
| _ | | | | only. Analysis field is not required, and | _ ′ |
| | | | | skipped if provided. | |
| use lakeiceana | \mid L | .FALSE. | | If .TRUE., analysis data for sea ice fraction | init mode=5,6 |
| _ | | | | are also used for freshwater lakes (for the | _ |
| | | | | time being restricted to the Great Lakes; | |
| | | | | extension to other lakes needs to be tested) | |
| qcana_mode | I | 0 | | If > 0 , analysis increments for cloud water | init_mode=5 |
| | | | | concentration are read and processed. | |
| | | | | 1: QC increments are added to QV | |
| | | | | increments | |
| | | | | 2: QC increments are added to QC if clouds | |
| | | | | are present, otherwise to QV increments | |
| qiana_mode | I | 0 | | 1: analysis increments for cloud ice | init_mode=5 |
| | | | | concentration are read and processed. | |

| Parameter | Type | Default | Unit | Description | Scope |
|------------------|------|---------|------|---|---------------------------------|
| qrsgana_mode | I | 0 | | 1: analysis increments for rain, snow and graupel mass concentrations are read and processed. In case of the 2-moment microphysics (inwp_gscp=4,5,6), also hail mass concentration increments are processed. | init_mode=5 |
| qnxana_2mom_mode | I | 0 | | Only effective in case of 2-moment microphysics (inwp_gscp=4,5,6). Affects the analysis increments of the the number concentrations of those hydrometeors in IAU which have been selected by the settings of qcana_mode, qiana_mode and qrsgana_mode: 0: analysis increments are not taken from analysis files but diagnosed based on the mass concentrations (from fg) and mass increments. 1: analysis increments are taken from the analysis files. If missing for a specific hydrometeor type, they are diagnosed | init_mode=5, inwp_gscp=4,5,6 |
| icpl_da_sfcevap | I | 0 | | similar to option 0 as a fallback. Coupling between data assimilation and model parameters controlling surface evaporation (bare soil and plants). Choosing values > 0 requires itype_vegetation_cycle=2 (in extpar_nml): 0: off 1: use time-filtered T2M bias provided by the soil moisture analysis 2: use in addition a time-filtered RH increment at the lowest model level (requires assimilation of RH2M) 3: as option 2, but use a time-filtered temperature increment at the lowest model level instead of the T2M bias provided by the SMA (requires assimilation of T2M and RH2M) | $init_mode=5$ |

| Parameter | Type | Default | Unit | Description | Scope |
|------------------------|-------------|---------|------|---|--------------------------|
| icpl_da_snowalb | I | 0 | | Coupling between temperature bias inferred | init_mode=5; |
| | | | | from data assimilation and snow albedo | $lcpl_da_sfcevap=3$ |
| | | | | 0: off | |
| | | | | 1: on; requires assimilation of T2M and | |
| | | | | cycling of a time-filtered temperature | |
| | | | | increment at the lowest model level | |
| | | | | 2: as option 1, but additional adaptation of | |
| | | | | sea-ice albedo | |
| icpl_da_skinc | | 0 | | Coupling between bias of diurnal | init_mode=5 |
| | | | | temperature amplitude inferred from data | |
| | | | | assimilation and skin conductivity | |
| | | | | 0: off | |
| | | | | 1: on; requires assimilation of T2M and | |
| | | | | cycling of a time-filtered weighted (with | |
| | | | | cosine of local time) temperature increment | |
| | | | | at the lowest model level | |
| | | | | 2: as option 1, but additional adaptation of | |
| | | | | soil heat conductivity and heat capacity | |
| $adjust_tso_tsnow$ | | .FALSE. | | If .TRUE., apply T increments for lowest | init_mode=5 |
| | | | | model level also to snow and upper soil | |
| | | | | layers (full to upper 3 cm, half to 3-9 cm | |
| | | | | layer). Requires assimilation of T2M to be | |
| | | Thu Th | | meaningful | 1 10450 |
| lconsistency_checks | | .TRUE. | | If .FALSE., consistency checks for Analysis | $init_mode=1,3,4,5,6$ |
| | | | | and First Guess fields are skipped. On | |
| | | | | default, checks are performed for | |
| 1 00 1 | T (1) | DALCE | | uuidOfHGrid and validity time. | |
| $l_coarse2fine_mode$ | $L(n_dom)$ | .FALSE. | | If true, apply corrections for coarse-to-fine | |
| ln0 sints in on | I (n. dom) | .FALSE. | | mesh interpolation to wind and temperature | init made 56 |
| lp2cintp_incr | $L(n_dom)$ | .FALSE. | | If true, interpolate atmospheric data assimilation increments from parent domain. | $ 	ext{init_mode=}5,6$ |
| | | | | Can be specified separately for each nested | |
| | | | | domain; setting the first (global) entry to | |
| | | | | true activates the interpolation for all nested | |
| | | | | domains. | |
| lp2cintp sfcana | L(n dom) | .FALSE. | | If true, interpolate atmospheric surface | init mode=5,6 |
| ipzciiiip_sicana | r(n-qom) | TALSE. | | analysis data from parent domain. | |
| | | | | Can be specified separately for each nested | |
| | | | | domain; setting the first (global) entry to | |
| | | | | true activates the interpolation for all nested | |
| | | | | domains. | |
| | | | | domains. | |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------------|----------|---------|------|--|---------------------------------|
| ltile_init | L | .FALSE. | | True: initialize tiled surface fields from a first | $init_mode=1,5,6$ |
| | | | | guess coming from a run without tiles. | |
| | | | | Along coastlines and lake shores, a neighbor | |
| | | | | search is executed to fill the variables on | |
| | | | | previously non-existing land or water points | |
| | | | | with reasonable values. Should be combined | |
| | | | | $with ltile_coldstart = .TRUE.$ | |
| ltile_coldstart | L | .FALSE. | | If true, tiled surface fields are initialized with | $ 	ext{init_mode=1,5,6} $ |
| | | | | tile-averaged fields from a previous run with | |
| | | | | tiles. | |
| | | | | A neighbor search is applied to subgrid-scale | |
| | | | | ocean points for SST and sea-ice fraction. | |
| lvert_remap_fg | L | .FALSE. | | If true, vertical remapping is applied to the | $ $ init_mode=5,6 |
| | | | | atmospheric first-guess fields, whereas the | |
| | | | | analysis increments remain unchanged. The | |
| | | | | number of model levels must be the same for | |
| | | | | input and output fields, and the z_ifc (alias | |
| | | | | HHL) field pertaining to the input fields | |
| | | | | must be appended to the first-guess file. | |

| | | | | " <path>dwdana_R<nroot>B<jlev>_DOM</jlev></nroot></path> | |
| | | | | <idom>.nc". May contain the keywords</idom> | |
| | | | | <pre><path> which will be substituted by</path></pre> | |
| | | | | model_base_dir, as well as nroot, nroot0, | |
| | | | | jlev, and idom defining the current patch. | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------------------|------|-------------|------|---|--------------------|
| filetype | I | -1 (undef.) | | One of CDI's FILETYPE_XXX constants. | |
| | | | | Possible values: 2 (=FILETYPE_GRB2), 4 | |
| | | | | (=FILETYPE_NC2). If this parameter has | |
| | | | | not been set, we try to determine the file | |
| | | | | type by its extension "*.grb*ör ".nc". | |
| $\frac{1}{1}$ check_fg(jg)%list | C(:) | | | In ICON a small subset of first guess input | $init_mode=1,5,6$ |
| | | | | fields is declared 'optional', meaning that | |
| | | | | they are read in if present, but they are not | |
| | | | | mandatory to start the model. By adding | |
| | | | | optional fields to this list, they become | |
| | | | | mandatory for domain jg, such that the | |
| | | | | model aborts if any of them is missing. This | |
| | | | | list may include a subset of the optional first | |
| | | | | guess fields, or even the entire set of first | |
| | | | | guess fields. On default this list is empty, | |
| | | | | such that optional fields experience a | |
| | | | | cold-start initialization if they are missing | |
| | | | | and the model does not abort. | |
| $check_ana(jg)\%list$ | C(:) | | | List of mandatory analysis fields for domain | $init_mode=1,5,6$ |
| | | | | jg that must be present in the analysis file. | |
| | | | | If these fields are not found, the model | |
| | | | | aborts. For all other analysis fields, the | |
| | | | | FG-fields will serve as fallback position. | |
| ana_varnames_map_ file | C | | | Dictionary file which maps internal variable | |
| | | | | names onto GRIB2 shortnames or NetCDF | |
| | | | | var names. This is a text file with two | |
| | | | | columns separated by whitespace, where left | |
| | | | | column: ICON variable name, right column: | |
| | | | | GRIB2 short name or NetCDF var name. | |
| itype_vert_expol | I | 1 | | Type of vertical extrapolation of initial data: | |
| | | | | 1: Linear extrapolation (standard) | |
| | | | | 2: Blend of linear extrapolation and simple | |
| | | | | climatology. Intended for upper-atmosphere | |
| | | | | simulations and specific settings can be | |
| | | | | found in upatmo_nml. Requires: ivctype = | |
| | | | | $[2, 12; l_limited_area = .FALSE.$ | |

Defined and used in: src/namelists/mo_initicon_nml.f90

2.21 interpol_nml

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------|------|---------|------|---|--------------------------|
| l_intp_c2l | L | .TRUE. | | DEPRECATED | |
| l_mono_c2l | L | .TRUE. | | Monotonicity can be enforced by demanding | |
| | | | | that the interpolated value is not higher or | |
| | | | | lower than the stencil point values. | |
| llsq_high_consv | L | .TRUE. | | conservative (T) or non-conservative (F) | |
| | | | | least-squares reconstruction for high order | |
| | | | | transport | |
| lsq_high_ord | I | 3 | | polynomial order of high order least-squares | ${ m ihadv_tracer} > 2$ |
| | | | | reconstruction for tracer transport | |
| | | | | 1: linear | |
| | | | | 2: quadratic | |
| | | | | 3: cubic | |
| llsq_lin_consv | L | .FALSE. | | conservative (T) or non-conservative (F) | |
| | | | | least-squares reconstruction for 2nd order | |
| | - | | | (linear) transport | |
| nudge_efold_width | R | 2.0 | | e-folding width (in units of cell rows) for | |
| | | | | lateral boundary nudging coefficient. This | |
| | | | | switch and the following two pertain to | |
| ı or | | 0.00 | | one-way nesting and limited-area mode Maximum relaxation coefficient for lateral | |
| nudge_max_coeff | R | 0.02 | | | |
| | | | | boundary nudging. Recommended range of values for limited-area mode is $0.06 - 0.075$. | |
| nudge zone width | I | 8 | | Total width (in units of cell rows) for lateral | |
| nudge_zone_width | 1 | 8 | | boundary nudging zone. For the limited-area | |
| | | | | mode, a minimum of 10 is recommended. If | |
| | | | | < 0 the patch boundary depth index is | |
| | | | | used. | |
| rbf_dim_c2l | 1 | 10 | | stencil size for direct lon-lat interpolation: 4 | |
| 101_4111_621 | 1 | 10 | | = nearest neighbor, 13 = vertex stencil, 10 | |
| | | | | | |
| | | | | = edge stencil. | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------------|----------|-------------|------|---|-------|
| rbf_scale_mode_ll | I | 2 | | Specifies, how the RBF shape parameter is | |
| | | | | determined for lon-lat interpolation. | |
| | | | | 1 : lookup table based on grid level | |
| | | | | 2: determine automatically. | |
| | | | | So far, this routine only estimates the | |
| | | | | smallest value for the shape parameter for | |
| | | | | which the Cholesky is likely to succeed in | |
| | | | | floating point arithmetic. 3: explicitly set | |
| | | | | shape parameter in each output namelist | |
| | | | | (namelist parameter | |
| | | | | output_nml::rbf_scale, p. 82). | |
| rbf vec kern c | I | 1 | | Kernel type for reconstruction at cell centres: | |
| | | | | 1: Gaussian | |
| | | | | 3: inverse multiquadric | |
| rbf_vec_kern_e | I | 3 | | Kernel type for reconstruction at edges: | |
| | | | | 1: Gaussian | |
| | | | | 3: inverse multiquadric | |
| rbf vec kern ll | I | 1 | | Kernel type for reconstruction at | |
| | | | | lon-lat-points: | |
| | | | | 1: Gaussian | |
| | | | | 3: inverse multiquadric | |
| rbf vec kern v | I | 1 | | Kernel type for reconstruction at vertices: | |
| | | | | 1: Gaussian | |
| | | | | 3: inverse multiquadric | |
| rbf_vec_scale_c | R(n dom) | resolution- | | Scale factor for RBF reconstruction at cell | |
| | | dependent | | centres | |
| rbf vec scale e | R(n dom) | resolution- | | Scale factor for RBF reconstruction at edges | |
| | | dependent | | | |
| rbf vec scale v | R(n dom) | • | | Scale factor for RBF reconstruction at | |
| | | dependent | | vertices | |
| support baryctr intp | L | .FALSE. | | Flag. If .FALSE. barycentric interpolation is | |
| | | | | replaced by a fallback interpolation. | |
| lreduced nestbdry stencil | L | .FALSE. | | Flag. If .TRUE. then the nest boundary | |
| | | | | points are taken out from the lat-lon | |
| | | | | interpolation stencil. | |

Defined and used in: src/namelists/mo_interpol_nml.f90

2.22 io_nml

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------|--------------|---------|-----------------------|---|---------------------------|
| lkeep_in_sync | L | .FALSE. | | Sync output stream with file on disk after | |
| | | | | each timestep | |
| dt_diag | R | 86400. | S | diagnostic integral output interval | run_nml:output = |
| | | | | | "totint" |
| ${ m dt_checkpoint}$ | R | 0 | S | Time interval for writing restart files. Note | output /= "none" |
| | | | | that if the value of dt_checkpoint resulting | (run_nml) |
| | | | | from model default or user's specification is | |
| | | | | longer than time_nml:dt_restart, it will be | |
| | | | | reset (by the model) to dt_restart so that at | |
| | | | | least one restart file is generated during the | |
| | | | | restart cycle. | |
| inextra_2d | I | 0 | | Number of extra 2D Fields for | dynamics_nml:iequations = |
| | | | | ${\rm diagnostic/debugging\ output.}$ | 3 |
| inextra_3d | I | 0 | | Number of extra 3D Fields for | dynamics_nml:iequations = |
| | | | | diagnostic/debugging output. | 3 |
| lflux_avg | L | .TRUE. | | if .FALSE. the output fluxes are accumulated | iequations=3 |
| | | | | from the beginning of the run | iforcing=3 |
| | | | | if .TRUE. the output fluxes are average | |
| | | | | values | |
| | | | | from the beginning of the run, except of | |
| | _ | | | TOT_PREC that would be accumulated | |
| itype_pres_msl | I | 1 | | Specifies method for computation of mean | |
| | | | | sea level pressure (and geopotential at | |
| | | | | pressure levels below the surface). | |
| | | | | 1: GME-type extrapolation, | |
| | | | | 2: stepwise analytical integration, | |
| | | | | 3: current IFS method, | |
| | | | | 4: IFS method with consistency correction | |
| | | | | 5: New DWD method constituting a mixture between IFS and old GME method | |
| | | | | (departure level for downward extrapolation | |
| | | | | ' = | |
| | | | | between 10 m and 150 m AGL depending on elevation) | |
| itype rh | I | 1 | | Specifies method for computation of relative | |
| httphe_in | 1 | 1 | | humidity | |
| | | | | 1: WMO-type: water only | |
| | | | | (e s=e s water), | |
| | | | | 2: IFS-type: mixed phase (water and ice), | |
| | | | | 3: IFS-type with clipping (rh ≤ 100) | |
| gust interval | R(n dom) | 3600. | s | Interval over which wind gusts are | iforcing=3 |
| 5000 = 111001 701 | 10(11-40111) | 3000. | 2 | maximized | 1101011116 |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------|----------|---------|--|---|------------|
| celltracks_interval | R(n_dom) | 3600. | S | Interval over which celltrack variables are maximized (lpi_max, uh_max, vorw_ctmax, w_ctmax, tcond_max, | iforcing=3 |
| ${ m dt_celltracks}$ | R(n_dom) | 120. | tcond10_max, dbz_ctmax) Interval at which celltrack variables except lpi (uh, vorw, w_ct, tcond, tcond10) are calculated to determine uh_max, vorw ctmax, w ctmax, tcond max, | | iforcing=3 |
| | | | | tcond10_max and dbz_ctmax | |
| dt _lpi | R(n_dom) | 180. | S | Interval at which lpi is calculated for determining lpi_max | iforcing=3 |
| dt_radar_dbz | R(n_dom) | 120. | S | Interval at which radar reflectivity is calculated for determining dbz ctmax | iforcing=3 |
| precip_interval | C(n_dom) | "P01Y" | | Interval over which precipitation variables are accumulated (rain_gsp, snow_gsp, graupel_gsp, ice_gsp, hail_gsp, prec_gsp, rain_con, snow_con, prec_con, tot_prec, prec_con_rate_avg, prec_gsp_rate_avg, tot_prec_rate_avg) | iforcing=3 |
| $\max_{}$ _interval | C(n_dom) | "PT06H" | | Interval over which max/min 2-m temperatures are calculated | iforcing=3 |
| ${\rm runoff_interval}$ | C(n_dom) | "P01Y" | | Interval over which surface and soil water runoff are accumulated | iforcing=3 |
| $sunshine_interval$ | C(n_dom) | "P01Y" | | Interval over which sunshine duration is accumulated | iforcing=3 |
| $itype_dursun$ | I | 0 | | Type of sunshine. 0 for WMO standard and for sunshine duration counted if $>120 \mathrm{W/m^2}$. In the case of type 1 (this is the MeteoSwiss definition) the sunshine duration is counted only if $>200 \mathrm{W/m^2}$ | iforcing=3 |

| Parameter | Type | Default | Unit | Description | Scope |
|---|----------------|----------------------|-------------------------|---|----------------------|
| echotop_meta | TYPE(n_dom) | | | Derived type to define properties of radar reflectivity echotops for each domain. Two | iforcing=3 |
| This type contains: | | | | types of echotops are available: minimum pressure ('echotop') and maximum height ('echotopinm') during a given time interval | |
| $echotop_meta(1:n_dom)\%time_interval$ | R(1) | 3600.0 | S | where a given reflectivity threshold is exeeded. Takes effect if 'echotop' and/or | |
| $echotop_meta(1:n_dom)\%dbzthresh$ | R(max_echotop) | (/18.0, 25.0, 35.0/) | $\mathrm{d}\mathrm{BZ}$ | 'echotopinm' is/are present in the ml_varlist of any domain-specific namelist | |
| | max_echotop=10 | | | output_nml. The derived type contains the echotop properties which are listed to the left, along with their defaults and units: time_interval: time interval [s] over which echotops are calculated dbzthresh: list of reflectivity thresholds [dBZ] for which echotops shall be computed You have to specify properties for each domain separately, e.g. echotop_meta(1)%time_interval=3600.0 echotop_meta(1)%dbzthresh=19.0,25.0,35.0,46.0 echotop_meta(2)%time_interval=1800.0 echotop_meta(2)%dbzthresh=27.0,36.0 | |
| output_nml_dict | C | , , | | File containing the mapping of variable names to the internal ICON names. May contain the keyword <path> which will be substituted by model_base_dir. The format of this file: One mapping per line, first the name as given in the ml_varlist, hl_varlist, pl_varlist or il_varlist of the output_nml namelists, then the internal ICON name, separated by an arbitrary number of blanks. The line may also start and end with an arbitrary number of blanks. Empty lines or lines starting with # are treated as comments. Names not covered by the mapping are used as they are.</path> | output_nml namelists |

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------------------|----------|---------|------|--|----------------------------|
| linvert_dict | L | .FALSE. | | If .TRUE., columns in dictionary file | |
| | | | | output_nml_dict are evaluated in inverse | |
| | | | | order. | |
| | | | | This allows using the same dictionary file as | |
| | | | | for input (ana_varnames_map_file in | |
| | | | | initicon_nml). | |
| netcdf _dict | C | , , | | File containing the mapping from internal | output_nml namelists, |
| | | | | names to names written to NetCDF. May | NetCDF output |
| | | | | contain the keyword <path> which will be</path> | |
| | | | | substituted by model_base_dir. | |
| | | | | The format of this file: | |
| | | | | One mapping per line, first the name written | |
| | | | | to NetCDF, then the internal name, | |
| | | | | separated by an arbitrary number of blanks | |
| | | | | (inverse to the definition of | |
| | | | | output nml dict). The line may also start | |
| | | | | and end with an arbitrary number of blanks. | |
| | | | | Empty lines or lines starting with # are | |
| | | | | treated as comments. | |
| | | | | Names not covered by the mapping are | |
| | | | | output as they are. | |
| | | | | Note that the specification of output | |
| | | | | variables, e. g. in ml_varlist, is independent | |
| | | | | from this renaming, see the namelist | |
| | | | | parameter output_nml_dict for this. | |
| lnetcdf flt64 output | L | .FALSE. | | If .TRUE. floating point variable output in | |
| | | | | NetCDF files is written in 64-bit instead of | |
| | | | | 32-bit accuracy. | |
| restart file type | I | 4 | | Type of restart file. One of CDI's | |
| J F | | | | FILETYPE XXX. So far, only 4 | |
| | | | | (=FILETYPE NC2) is allowed | |
| restart write mode | \mid C | "" | | Restart read/write mode. | |
| | | | | Allowed settings (character strings!) are | |
| | | | | listed below. | |
| nrestart streams | l I | 1 | | When using the restart write mode | restart_write_mode = |
| | | | | "dedicated procs multifile", it is possible to | "dedicated procs multifile |
| | | | | split the restart output into several files, as if | double process marchine |
| | | | | nrestart_streams * num_io_procs restart | |
| | | | | processes were involved. This speeds up the | |
| | | | | read-in process, since all the files may then | |
| | | | | be read in parallel. | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------|------|---------|------|--|-------|
| lmask_boundary | L | F | | Set to .TRUE., if interpolation zone should | |
| | | | | be masked in triangular output. | |
| bvf2_mode | I | 1 | | Computation mode for square of | |
| | | | | Brunt-Vaisala frequency: | |
| | | | | 1: standard, $N^2 = (g/\theta_v)\partial\theta_v/\partial z$ | |
| | | | | 2: hydrostatic, $N^2 = (g/T_v)(\partial T_v/\partial z + g/c_p)$ | |
| | | | | 3: dk1982, standard computation is extended | |
| | | | | by considering water vapor saturation effects | |
| | | | | (after Durran & Klemp, 1982, "On the | |
| | | | | effects of moisture on the Brunt-Vaisala | |
| | | | | frequency"). | |
| $parcelfreq2_mode$ | I | 11 | | Computation mode for square of general air | |
| | | | | parcel oscillation frequency*: | |
| | | | | 11: standard + unrestricted oscillation | |
| | | | | 12: standard + vertical oscillation | |
| | | | | 21: hydrostatic + unrestricted oscillation | |
| | | | | 12: hydorstatic + vertical oscillation | |
| | | | | Please not: the computation of parcelfreq2 is | |
| | | | | extremely expensive (runtime and memory), | |
| | | | | use with care! | |
| | | | | (* See Ertel, Jaw & Li, 1941, "Tensorielle | |
| | | | | Theorie der Stabilität".) | |

2.22.1 Restart read/write mode:

Allowed settings for restart_write_mode are:

"sync"

'Old' synchronous mode. PE # 0 reads and writes restart files. All other PEs have to wait.

"async"

Asynchronous restart writing: Dedicated PEs (num_restart_proc > 0) write restart files while the simulation continues. Restart PEs can only parallelize over different patches. — Read-in: PE # 0 reads while other PEs have to wait.

"joint procs multifile"

All worker PEs write restart files to a dedicated directory. Therefore, the directory itself is called the restart file. The information is stored in a way that it can be read back into the model independent from the processor count and the domain decomposition. — Read-in: All worker PEs read the data in parallel.

"dedicated procs multifile"

In this case, all the restart data is first transferred to memory buffers in dedicated restart writer PEs. After that, the work processes carry on with their work immediately, while the restart writers perform the actual restart writing asynchronously. Restart PEs can parallelize over patches and horizontal indices. — Read-in: All worker PEs read the data in parallel..

,, ,,

Fallback mode.

If num_restart_proc == 0 (parallel_nml), then this behaves like "sync", otherwise like "async".

2.22.2 Some notes on the output of optional diagnostics:

■ How can I switch on the output of one of the available diagnostics?

Let us assume that you would like to output $potential\ vorticity$ (see table of available diagnostics below) on model levels. Simply add the following element to the desired output namelist (see 2.36) in your run script:

```
&output_nml
...
ml_varlist = ..., 'pv'
...
```

Please note that the output of some diagnostics is restricted to the NWP mode (iforcing = inwp = 3, see column "Scope" in the table 24 below).

■ Which optional diagnostics are currently available for output?

Here is a table of the available diagnostics and some additional information on them.

Tabelle 24: Optional diagnostics (last update Aug. 2020)

| Short | Long name | Unit | Scope | Shape | | Place of |
|-----------|--|------------------|--|-------|-------------------------------|------------------|
| name* | | | | | in io_nml | computation |
| | | | | | | in source code** |
| rh | relative humidity | % | $ig egin{array}{l} 	ext{iforcing} = 	ext{inwp} \ = 3 \end{array}$ | 3d | itype_rh | [1] |
| pv | potential vorticity | K m2 kg-1 s-1 | iforcing = inwp | 3d | - | [2] |
| sdi2 | supercell detection index (SDI2) | s-1 | iforcing = inwp | 2d | - | [2] |
| lpi | lightning potential index (LPI) | J kg-1 | iforcing = inwp | 2d | - | [2] |
| lpi_max | lightning potential index, maximum during prescribed time interval | J kg-1 | iforcing = inwp | 2d | celltracks_interval dt_lpi | [2] |
| ceiling | ceiling height | m | if $orcing = inwp$ | 2d | - | [2] |
| hbas_sc | cloud base above msl, shallow convection | m | iforcing = inwp | 2d | - | [2] |
| htop_sc | cloud top above msl, shallow convection | m | iforcing = inwp | 2d | - | [2] |
| twater | total column-integrated water | kg m-2 | iforcing = inwp | 2d | - | [2] |
| q_sedim | specific content of precipitation particles | kg kg-1 | iforcing = inwp | 2d | - | [2] |

Tabelle 24: Optional diagnostics (last update Aug. 2020)

| Short name* | Long name | Unit | Scope | Shape | Specifications in io_nml | Place of computation in source code** |
|----------------|--|--------|-----------------------------------|-------|--------------------------------------|---|
| tcond_max | total column-integrated condensate, maximum during prescribed time interval | kg m-2 | iforcing = inwp | 2d | celltracks_interval dt_celltracks | [2] |
| tcond10_max | total column-integrated condensate above $z(T=-10~{\rm deg}C)$, maximum during prescribed time interval | kg m-2 | iforcing = inwp | 2d | celltracks_interval dt_celltracks | [2] |
| uh_max | updraft helicity, maximum during prescribed time interval | m2 s-2 | iforcing = inwp | 2d | celltracks_interval dt_celltracks | [2] |
| vorw_ctmax | maximum rotation amplitude during prescribed time interval | s-1 | $ 	ext{iforcing} = 	ext{inwp} $ | 2d | celltracks_interval dt_celltracks | [2] |
| w_ctmax | maximum updraft track during prescribed time interval | m s-1 | iforcing = inwp | 2d | celltracks_interval dt_celltracks | [2] |
| dbz | radar reflectivity | dBZ | iforcing = inwp | 3d | - | [2] |
| dbz_cmax | column maximum reflectivity | dBZ | iforcing = inwp | 2d | - | [2] |
| dbz_850 | reflectivity in approx. 850 hPa | dBZ | iforcing = inwp | 2d | - | [2] |
| dbz_ctmax | column and time maximum reflectivity during prescribed time interval | dBZ | $ 	ext{iforcing} = 	ext{inwp} $ | 2d | celltracks_interval dt_radar_dbz | [2] |
| echotop | minimum pressure of exceeding radar reflectivity threshold during prescribed time interval | Pa | iforcing = inwp | 3d | celltracks_interval echotop_meta | [2] |
| echotopinm | maximum height of exceeding radar reflectivity threshold during prescribed time interval | m | iforcing = inwp | 3d | celltracks_interval echotop_meta | [2] |
| pres_msl | mean sea level pressure | Pa | - | 2d | itype_pres_msl | [3] |
| omega | vertical (pressure) velocity | Pa s-1 | - | 3d | - | [2] |
| vor_u | zonal component of relative vorticity | s-1 | - | 3d | - | [4] |
| vor_v | meridional component of relative vorticity | s-1 | - | 3d | - | [4] |
| bvf2 | square of Brunt-Vaisala frequency | s-2 | - | 3d | bvf2_mode | [5] |
| parcelfreq2 | square of air parcel oscillation frequency | s-2 | | 3d | $parcelfreq2_mode$ | [5] |

^{*} To be used in output_nml.

** The keys, [1], [2], etc., are itemized under the following point.

[■] Where can I find more about the computation of the diagnostics in the source code?

As for the ICON model component of the non-hydrostatic atmosphere:

Each optional diagnostic has its own switch in the source code of ICON which is set to .TRUE. if the diagnostic is found in one of the output_nml in your run script. This configuration can be found in the module:

/src/configure_model/mo_io_config.

Further information on the metadata of the diagnostics can be found in their allocation area. For the diagnostics that are meant for the NWP mode of ICON (iforcing = inwp = 3, see column "Scope" in table 24 above), the allocation takes place in:

/src/atm_phy_nwp/mo_nwp_phy_state.

Optional diagnostics with unrestricted scope are allocated in:

/src/atm_dyn_iconam/mo_nonhydro_state.

The job control of the computation and output of most of the optional diagnostics is organized by the post-processing scheduler:

/src/atm_dyn_iconam/mo_pp_scheduler,

/src/atm_dyn_iconam/mo_pp_tasks,

and integrated into the main time loop in:

/src/atm_dyn_iconam/mo_nh_stepping.

The job control of a small portion of the diagnostics is organized in:

/src/atm_phy_nwp/mo_nwp_diagnosis.

Finally, the computation of the individual diagnostics can be found in the following modules (the assignment of the keys, [1], [2], etc., to the respective diagnostic is found in the column "Place of computation in source code" of table 24 above):

- [1] /src/atm_phy_nwp/mo_util_phys
- [2] /src/atm_phy_nwp/mo_opt_nwp_diagnostics
- [3] /src/atm_phy_nwp/mo_nh_diagnose_pmsl
- [4] /src/diagnostics/atmosphere/mo_diag_atmo_air_flow
- [5] /src/diagnostics/atmosphere/mo_diag_atmo_air_parcel

Defined and used in: $src/namelists/mo_io_nml.f90$

2.23 les nml (parameters for LES turbulence scheme; valid for inwp turb=5)

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|--------|---|------------------------|
| sst | R | 300 | K | sea surface temperature for idealized LES | $isrfc_type=5,4$ |
| | | | | simulations | |
| shflx | R | 0.1 | m Km/s | Kinematic sensible heat flux at surface | ${ m isrfc_type} = 2$ |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------|------|---------|------|--|----------------------|
| $itype_latbc$ | I | 0 | | Type of lateral boundary nudging. | |
| | | | | 0: constant lateral boundary conditions | |
| | | | | derived from the initial conditions, | |
| | | | | 1: time-dependent lateral boundary | |
| | | | | conditions provided by an external source | |
| | | | | (IFS, COSMO or a coarser-resolution ICON | |
| | | | | run) | |
| dtime latbc | R | 10800.0 | S | Time difference between two consecutive | itype_latbc ≥ 1 |
| _ | | | | boundary data. (Upper bound for | |
| | | | | asynchronous read-in: $1 \text{ day} = 86400 \text{ s.}$ | |
| init latbe from fg | L | .FALSE. | | If .TRUE., take lateral boundary conditions | itype latbc ≥ 1 |
| | | | | for initial time from first guess (or analysis) | |
| | | | | field | |
| nudge hydro pres | L | .TRUE. | | If .TRUE., hydrostatic pressure is used to | itype latbc ≥ 1 |
| | | | | compute lateral boundary nudging | |
| | | | | (recommended if boundary conditions | |
| | | | | contain hydrostatic pressure, which is | |
| | | | | usually the case) | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------|----------|---------|------|--|-------------------------|
| fac_latbc_presbiascor | R | 0. | | Scaling factor for pressure bias correction at | $itype_latbc \ge 1,$ |
| | | | | lateral boundaries. Requires running in data | $ $ init_mode=5 |
| | | | | assimilation cycle. Recommended value for | |
| | | | | activating the option is 1. | |
| $latbc_filename$ | C | | | Filename of boundary data input file, these | $ itype_latbc = 1$ |
| | | | | files must be located in the latbc_path | |
| | | | | directory. Default: | |
| | | | | "prepiconR <nroot>B<jlev>_<y><m><d><h>.r</h></d></m></y></jlev></nroot> | վ c ''. |
| | | | | The filename may contain keyword tokens | |
| | | | | (day, hour, etc.) which will be automatically | |
| | | | | replaced during the run-time. See the table | |
| | | | | below for a list of allowed keywords. | |
| latbc_path | C | l | | Absolute path to boundary data. | $ itype_latbc = 1$ |
| latbc_boundary_grid | C | "" | | Grid file defining the lateral boundary. | $ itype_latbc = 1$ |
| | | | | Empty string means: whole domain is read | |
| | | | | for the lateral boundary. This NetCDF grid | |
| | | | | file must contain two integer index arrays: | |
| | | | | <pre>int global_cell_index(cell), int</pre> | |
| | | | | global_edge_index(edge), both with | |
| | | | | attributes nglobal which contains the global | |
| | | | | size size of the non-sparse cells and edges. | |
| latbc_varnames_map_ file | C | | | Dictionary file which maps internal variable | $num_prefetch_proc=1$ |
| | | | | names onto GRIB2 shortnames or NetCDF | |
| | | | | var names. This is a text file with two | |
| | | | | columns separated by whitespace, where left | |
| | | | | column: ICON variable name, right column: | |
| | | | | GRIB2 short name. This list contains | |
| | | | | variables that are to be read asynchronously | |
| | | | | for boundary data nudging in a HDCP2 simulation. All new boundary variables that | |
| | | | | in the future, would be read asynchronously. | |
| | | | | Need to be added to text file dict.latbc in | |
| | | | | run folder. | |
| latbc_contains_qcqi | \mid L | .TRUE. | | Set to .FALSE. if there is no qc, qi in latbo | |

$2.30\ meteogram_output_nml$

This namelist is relevant if run_nml:output="nml". Nearest neighbour 'interpolation' is used for all variables.

| Parameter | Type | Default | Unit | Description | Scope |
|------------------------------|----------|----------------|------|---|-------|
| lmeteogram_enabled | L(n_dom) | .FALSE. | | Flag. True, if meteogram of output variables | |
| | | | | is desired. | |
| zprefix | C(n_dom) | "METEO | | string with file name prefix for output file | |
| | | GRAM_" | | | |
| ldistributed | L(n dom) | .TRUE. | | Flag. Separate files for each PE. | |
| loutput_tiles | L _ | .FALSE. | | Write tile-specific output for some selected | |
| | | | | surface/soil fields | |
| $n0_{mtgrm}$ | I(n_dom) | 0 | | initial time step for meteogram output. | |
| ninc_mtgrm | I(n_dom) | 1 | | output interval (in time steps) | |
| stationlist_tot | | 53.633, 9.983, | | list of meteogram stations (triples with lat, | |
| | | 'Hamburg' | | lon, name string) | |
| silent_flush | L(n_dom) | 1 | | do not warn about flushing to disk if .TRUE. | |
| $\max_{\text{time_stamps}}$ | I(n_dom) | 1 | | number of output time steps to record in | |
| | | | | memory before flushing to disk | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|------|---|-------|
| var_list | C(:) | | | Positive-list of variables (optional). Only | |
| | | | | variables contained in this list are included | |
| | | | | in the meteogram. If the default list is not | |
| | | | | changed by user input, then all available | |
| | | | | variables are added to the meteogram | |

Defined and used in: src/namelists/mo_mtgrm_nml.f90

2.31 nonhydrostatic_nml (relevant if run_nml:iequations=3)

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------|---------------|---------|------|---|--------------|
| $itime_scheme$ | I | 4 | | Options for predictor-corrector time-stepping | |
| | | | | scheme: | |
| | | | | 4: Contravariant vertical velocity is | iequations=3 |
| | | | | computed in the predictor step only, velocity | |
| | | | | tendencies are computed in the corrector | |
| | | | | step only (most efficient option) | |
| | | | | 5: Contravariant vertical velocity is | |
| | | | | computed in both substeps (beneficial for | |
| | | | | numerical stability in very-high resolution | |
| | | | | setups with extremely steep slops, otherwise | |
| | | | | no significant impact) | |
| | | | | 6: As 5, but velocity tendencies are also | |
| | | | | computed in both substeps (no apparent | |
| | | | | benefit, but more expensive) | |
| rayleigh_type | | 2 | | Type of Rayleigh damping | |
| | | | | 1: CLASSICAL (requires velocity reference | |
| | | | | state!) | |
| | | | | 2: Klemp (2008) type | |
| rayleigh_coeff | $ R(n_dom) $ | 0.05 | | Rayleigh damping coefficient $1/\tau_0$ (Klemp, | |
| | | | | Dudhia, Hassiotis: MWR136, pp.3987-4004); | |
| | | | | higher values are recommended for R2B6 or | |
| | | | | finer resolution | |
| $- { m damp_height}$ | $ R(n_dom) $ | 45000 | m | Height at which Rayleigh damping of | |
| | | | | vertical wind starts (needs to be adjusted to | |
| | | | | model top height; the damping layer should | |
| | | | | have a depth of at least 20 km when the | |
| | | | | model top is above the stratopause) | |

| Parameter | Type | Default | Unit | Description | Scope |
|------------------|--------------|-----------|------|---|----------------------------------|
| htop_moist_proc | R | 22500.0 | m | Height above which moist physics and | |
| | | | | advection of cloud and precipitation | |
| | | | | variables are turned off | |
| hbot qvsubstep | ight] R | 22500.0 | m | Height above which QV is advected with | ihadv_tracer=22, 32, 42 or |
| | | | | substepping scheme | $\mid 52 \mid$ |
| htop tracer proc | R | 1000000.0 | m | Height above which physical processes and | tracers with an index \geq iqt |
| | | | | advection of additional tracer variables are | _ |
| | | | | turned off; the default value is set to an very | |
| | | | | high value, i.e. by default this possible | |
| | | | | restriction is not active. This value is taken | |
| | | | | for all additional tracers in the tracer | |
| | | | | container with an index equal or greater | |
| | | | | than iqt; it may be overwritten for specific | |
| | | | | ART tracers by the tag 'htop proc' in the | |
| | | | | XML file when defining the individual ART | |
| | | | | tracers. | |
| vwind offetr | \mathbb{R} | 0.15 | | Off-centering in vertical wind solver. Higher | |
| _ | | | | values may be needed for R2B5 or coarser | |
| | | | | grids when the model top is above 50 km. | |
| | | | | Negative values are not allowed | |
| rhotheta offctr | ight R | -0.1 | | Off-centering of density and potential | |
| _ | | | | temperature at interface level (may be set to | |
| | | | | 0.0 for R2B6 or finer grids; positive values | |
| | | | | are not recommended) | |
| veladv offctr | \mathbb{R} | 0.25 | | Off-centering of velocity advection in | |
| _ | | | | corrector step. Negative values are not | |
| | | | | recommended | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------|------|---------|------|---|---|

| | | | | horizontal temperature diffusion is activated | $l_zdiffu_t = .true.$ |
| | | | | (alternative criterion to thslp_zdiffu) | |
| exner_expol | R | 1./3. | | Temporal extrapolation (fraction of dt) of | |
| | | | | Exner function for computation of horizontal | |
| | | | | pressure gradient. This damps horizontally | |
| | | | | propagating sound waves. For R2B5 or | |
| | | | | coarser grids, values between $1/2$ and $2/3$ | |
| | | | | are recommended. Model will be numerically | |
| | | | | unstable for negative values. | |
| l_open_ubc | L | .FALSE. | | .TRUE.: Use open upper boundary condition | |
| | | | | (rather than w=0) to allow vertical motions | |
| | | | | related to diabatic heating to extend beyond | |
| | | | | the model top | |

Defined and used in: src/namelists/mo_nonhydrostatic_nml.f90

2.32 nudging_nml

Parameters for the upper boundary nudging in the limited-area mode (grid_nml: l_limited_area = .TRUE.) or global nudging. For the lateral boundary nudging, please see interpol_nml and limarea_nml. The characteristics of the driving data for the nudging can be specified in limarea_nml.

| Parameter | Type | $\mathbf{Default}$ | Unit | Description | Scope |
|------------|----------|--------------------|---|---|--------------------------------------|
| nudge_type | I(n_dom) | 0 | | Nudging type: | run_nml : if $orcing = 3$ |
| | | | | * 0: none | $(N\overline{W}P)$ |
| | | | | * 1: upper boundary nudging | $ 	ext{ivctype} = 2 	ext{ (SLEVE)}$ |
| | | | | * 2: global nudging | |
| | | | | Please note: | |
| | | | | • nudge_type = 1 requires l_limited_area = .TRUE. | |
| | | | | • nudge type $= 1$ is also applicable to | |
| | | | | nested domains. Nudging is performed | |
| | | | | against the same forcing data set for all | |
| | | | | domains. If nudging is enabled for one or | |
| | | | | more nested domains, it needs to be enabled | |
| | | | | for the base domain, as well. | |
| | | | | • nudge_type = 2 (global nudging) is | |
| | | | | applied in primary domain only | |
| | | | | • for global nudging the following settings in | |
| | | | | limarea_nml are mandatory: | |
| | | | | - itype_latbc = 1 (time-dependent driving | |
| | | | | data) | |
| | | | | - $dtime_latbc = \dots$ | |
| | | | | $- \text{latbc_path} = "\dots"$ | |
| | | | | - latbc_boundary_grid = " " (no boundary | |
| | | | | grid: driving data have to be available on | |
| | | | | entire grid) | |
| | | | | - $latbc_varnames_map_file = ""$ (e.g., | |
| | | | | $run/dict.latbc)$, if $num_prefetch_proc = 1$ | |
| | | | | (asynchronous read-in of driving data) | |
| | | | • defaults and (additional) scopes for global | | |
| | | | | nudging are marked by $(\cdot)_{glbndg}$, if a | |
| | | | | parameter applies to both upper boundary | |
| | | | and global nudging | | |

| Parameter | Type | Default | Unit | Description | Scope |
|--|------|-----------------------------------|------|--|--|
| max_nudge_coeff_vn | R | 0.04 (0.016) _{glbndg} | | Max. nudging coefficient for the horizontal wind (i.e. the edge-normal wind component v_n). Given the wind update due to the nudging term on the rhs: $v_n(t) = v_n^*(t) + \text{nudge_coeff_vn}(z) *$ ndyn_substeps * $[\overline{v_n}(t) - v_n^*(t)]$, where t and z denote time and height, respectively, $\overline{v_n}(t)$ is the target wind to nudge to, and v_n^* is the value before the nudging, the vertical profile of the coefficient for upper boundary nudging reads: nudge_coeff_vn(z) = $\max_{n=1}^{\infty} \frac{1}{n} $ | <pre>nudge_type > 0 (nudge_var = "all" or ",vn,")glbndg</pre> |
| $ootnotesize \text{max_nudge_coeff_thermdyn}$ | R | 0.075 $(0.03)_{ m glbndg}$ | 1 | Max. nudging coefficient for the thermodynamic variables selected by limarea_nml: nudge_hydro_pres in case of upper boundary nudging and by thermdyn_type in case of global nudging. The range of validity is max_nudge_coeff_thermdyn ∈ [0, ~ 1/ndyn_substeps], where the lower boundary is mandatory. | <pre>nudge_type > 0 (nudge_var = "all" or ",thermdyn,")glbndg</pre> |

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------------|------|-----------------------------------|------|--|--|
| nudge_start_height | R | 12000 (2000) _{glbndg} | m | Nudging is applied for: $nudge_start_height \le z \le top_height$ in case of upper boundary nudging and for: $nudge_start_height \le z \le$ $nudge_end_height$ in case of global $nudging$, where z denotes the nominal height of the grid layer center, and top_height is the height of the model top (see sleve_nml). For upper boundary nudging the range of validity is $nudge_start_height \in [0, top_height]$, where both boundaries are mandatory. For global $nudging$ a $nudge_start_height$ in the range $[0, top_height]$ has to satisfy $nudge_start_height < nudge_end_height$. Values outside $[0, top_height]$ will be $interpreted$ as $nudge_start_height = 0$. | nudge_type > 0 |
| max_nudge_coeff_qv | R | 0.008 | 1 | Max. nudging coefficient for water vapor. The range of validity is $ \begin{array}{l} \text{max_nudge_coeff_qv} \in [0, \sim \\ 1/\text{ndyn_substeps}], \text{ where the lower} \\ \text{boundary is mandatory. (For global nudging only.)} \\ \end{array} $ | $egin{aligned} \operatorname{nudge_type} &= 2 \\ \operatorname{nudge_var} &= \operatorname{"all"} \ \operatorname{or} \\ \operatorname{",qv,} \end{array}$ |
| $ m nudge_end_height$ | R | 40000 | m | Nudging is applied for: | $ m nudge_type = 2$ |

| | Type | Default | Unit | | Scope |
|-------------------------|--------|-----------|------|---|--|
| Parameter nudge_profile | Type I | Default 4 | Unit | Vertical profile of the nudging coefficient (nudging strength) between nudge_start_height and nudge_end_height: * 1: squared scaled vertical distance from nudge_start_height (this is the profile used for upper boundary nudging) * 2: constant profile * 3: hyperbolic tangent profile * 4: trapezoidal profile The profile values range from 0 to 1. A multiplication with max_nudge_coeff_vn/thermdyn/qv and ndyn_substeps yields the final value of the nudging coefficient. (For global nudging only.) | $egin{align*} Scope \ nudge_type = 2 \ \end{array}$ |
| nudge_scale_height | R | 3000 | m | Scale height of nudging profile. (For global nudging only.) | $egin{array}{c} 	ext{nudge_type} = 2 \ 	ext{nudge_profile} = 3 	ext{ or } 4 \end{array}$ |
| nudge_var | С | "all" | | Select the variables that shall be nudged: * "vn": horizontal wind * "thermdyn": thermodynamic variables * "qv": water vapor * comma-separated list: e.g., "vn,thermdyn" * "all": all available variables (i.e. equivalent to "vn,thermdyn,qv") Please note that the nudging of water vapor requires ltransport = .TRUE. (For global nudging only.) | $\mathrm{nudge_type} = 2$ |
| $thermdyn_type$ | I | 1 | | Set of variables used to compute the thermodynamic nudging increments: * 1: hydrostatic set (pressure and temperature) * 2: non-hydrostatic set (density and virtual potential temperature) | $egin{aligned} & \text{nudge_type} = 2 \\ & \text{nudge_var} = \text{"all" or} \\ & \text{",thermdyn,"} \end{aligned}$ |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|------|---|----------------------------|
| idiagnose | I | -1 | | Switch for nudging diagnostics: | $\mathrm{nudge_type} = 2$ |
| | | | | $* \le 0$: switched off | ${ m msg_level}>=11$ |
| | | | | *>0: each (idiagnose * dtime) time | |
| | | | | diagnostics are computed and written to the | |
| | | | | ASCII file "nudging_diagnostics.txt". | |
| | | | | The nudging diagnostics are: | |
| | | | | • correlation between the mean sea-level | |
| | | | | pressure from ICON on the one hand and | |
| | | | | from the driving model on the other hand (a | |
| | | | | measure for the nudging success) | |
| | | | | • global mean of the absolute horizontal | |
| | | | | wind divergence (a measure for the nudging | |
| | | | | impact on the atmospheric "noise" or the | |
| | | | | gravity wave activity, depending on the | |
| | | | | perspective) | |
| | | | | • global mean of the absolute surface | |
| | | | | pressure time tendency (a further measure | |
| | | | | for the nudging impact) | |
| | | | | (For global nudging only.) | |

Defined and used in: src/namelists/mo_nudging_nml.f90

2.33 nwp_bench_nml

The switches to disable subroutine calls inside the time_loop. These are used for early GPU benchmarks of ICON while not everything is ported. They should be removed again once the port is ready to support all the subroutine calls in this list.

| Parameter | Type | Default | Unit | Description | Scope |
|------------|------|---------|------|--|-------|
| d_{unpb} | L | .FALSE. | | disables the call to update_nwp_phy_bcs if | |
| | | | | set to .TRUE. | |
| d_ndfo | L | .FALSE. | | disables the call to nwp_diag_for_output if | |
| | | | | set to .TRUE. | |
| d_rld | L | .FALSE. | | disables the call to recv_latbc_data if set to | |
| | | | | .TRUE. | |
| d_n | L | .FALSE. | | disables the call to nudging if set to .TRUE. | |
| d_{wnlo} | L | .FALSE. | | disables the call to write_name_list_output | |
| | | | | if set to .TRUE. | |

Defined and used in: src/namelists/mo_bench_nml.f90

2.34 nwp phy nml

The switches for the physics schemes and the time steps can be set for each model domain individually. If only one value is specified, it is copied to all child domains, implying that the same set of parameterizations and time steps is used in all domains. If the number of values given in the namelist is larger than 1 but less than the number of model domains, then the settings from the highest domain ID are used for the remaining model domains.

If the time steps are not an integer multiple of the advective time step (dtime), then the time step of the respective physics parameterization is automatically rounded to the next higher integer multiple of the advective time step. If the radiation time step is not an integer multiple of the cloud-cover time step it is automatically rounded to the next higher integer multiple of the cloud cover time step.

| Parameter | Type | Default | Unit | Description | Scope |

Defined and used in: src/namelists/mo_nwp_tuning_nml.f90

2.36 output_nml (relevant if run_nml/output='nml')

Please note: There may be several instances of output_nml in the namelist file, every one defining a list of variables with separate attributes for output.

| Parameter | Type | Default | Unit | Description | Scope |
|------------------------|----------|------------------|------|--|-------|
| dom | I(:) | -1 | | Array of domains for which this name-list is used. If not specified (or specified as -1 as | |
| | | | | the first array member), this name-list will | |
| | | | | be used for all domains. Attention: Depending on the setting of the | |
| | | | | parameter l output phys patch these are | |
| | | | | either logical or physical domain numbers! | |
| file interval | \mid C | "" | | Defines the length of a file in terms of an | |
| _ | | | | ISO-8601 duration string. An example for | |
| | | | | this time stamp format is given below. This | |
| | | | | namelist parameter can be set instead of | |
| | | | | steps_per_file. | |
| ${f filename_format}$ | C | see description. | | Output filename format. Includes keywords | |
| | | | | path, output_filename, physdom, etc. (see below). Default is | |
| | | | | <pre><output_filename>_DOM<physdom>_<levtype< pre=""></levtype<></physdom></output_filename></pre> | |
| | | | | <pre><jfile></jfile></pre> | |
| ${\it filename_extn}$ | C | "default" | | User-specified filename extension (empty | |
| | | | | string also possible). If this namelist | |
| | | | | parameter is chosen as "default", then we | |
| | | | | have ".nc"for NetCDF output files, and | |
| | | | | \mid ".grb"for GRIB1/2. | |

| Parameter | Type | Default | Unit | Description | Scope |
|---|------|---------|------|---|-------|
| filetype | I | 4 | | One of CDI's FILETYPE_XXX constants. | |
| | | | | Possible values: | |
| | | | | 2=FILETYPE GRB2, | |
| | | | | 4=FILETYPE NC2, | |
| | | | | 5=FILETYPE NC4 | |
| m levels | C | None | | Model level indices (optional). | |
| _ | | | | Allowed is a comma- (or semicolon-) | |
| | | | | separated list of integers, and of integer | |
| | | | | ranges like "1020". One may also use the | |
| | | | | keyword "nlev" to denote the maximum | |
| | | | | integer (or, equivalently, "nör "N"). | |
| | | | | Furthermore, arithmetic expressions like | |
| | | | | "(nlev - 2)äre possible. | |
| | | | | Basic example: | |
| | | | | m_levels = "1,3,510,20(nlev-2)" | |
| | | | | m_levels = 1,3,010,20(niev-2) | |
| h_{levels} | R(:) | None | m | height levels | |
| p_levels | R(:) | None | Pa | pressure levels | |
| i_levels | R(:) | None | K | isentropic levels | |
| ml varlist | C(:) | None | | Name of model level fields to be output. | |
| hl varlist | C(:) | None | | Name of height level fields to be output. | |
| pl varlist | C(:) | None | | Name of pressure level fields to be output. | |
| il varlist | C(:) | None | | Name of isentropic level fields to be output. | |
| $\stackrel{-}{\operatorname{include}}$ last | | .TRUE. | | Flag whether to include the last time step | |
| mode | I | 2 | | 1 = forecast mode, $2 =$ climate mode | |
| | | | | In climate mode the time axis of the output | |
| | | | | file is set to TAXIS_ABSOLUTE. In | |
| | | | | forecast mode it is set to | |
| | | | | TAXIS RELATIVE. Till now the forecast | |
| | | | | mode only works if the output is at multiples | |
| | | | | of 1 hour | |

| Parameter | Type | Default | Unit | Description | Scope |
|--|--------|---------|------|---|--------|
| taxis_tunit | I | 2 | | Time unit of the TAXIS_RELATIVE time | mode=1 |
| | | | | axis. | |
| | | | | $1 = TUNIT_SECOND$ | |
| | | | | $2 = { m TUNIT_MINUTE}$ | |
| | | | | $5 = { m TUNIT_HOUR}$ | |
| | | | | $9 = TUNIT_DAY$ | |
| | | | | For a complete list of possible values see | |
| | | | | cdilib.c | |
| ${f output_bounds}$ | R(k*3) | None | | Post-processing times: start, end, increment. | |
| | | | | We choose the advection time step matching | |
| | | | | or following the requested output time, | |
| | | | | therefore we require output_bounds(3) > | |
| | | | | dtime. Multiple triples are possible in order | |
| | | | | to define multiple starts/ends/intervals. See | |
| | | | | namelist parameters output_start, | |
| | | | | output_end, output_interval for an | |
| | _ | | | alternative specification of output events. | |
| $oxed{ egin{array}{c} { m output_time_unit} }$ | I | 1 | | Units of output bounds specification. | |
| | | | | 1 = second | |
| | | | | 2 = minute | |
| | | | | 3 = hour | |
| | | | | 4 = day | |
| | | | | $egin{array}{l} 5 = \mathrm{month} \ 6 = \mathrm{year} \end{array}$ | |
| output filename | C | None | | Output filename prefix (which may include | |
| output_mename | | None | | path). Domain number, level type, file | |
| | | | | number and extension will be added, | |
| | | | | according to the format given in namelist | |
| | | | | parameter "filename format". | |
| output grid | L | .FALSE. | | Flag whether grid information is added to | |
| _Strate_Strate | | | | output. | |
| output start | C(:) | "" | | ISO8601 time stamp for begin of output. An | |
| F | | | | example for this time stamp format is given | |
| | | | | below. More than one value is possible in | |
| | | | | order to define multiple start/end/interval | |
| | | | | triples. See namelist parameter | |
| | | | | output_bounds for an alternative | |
| | | | | specification of output events. | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------------------|--------------|------------|------|--|-------|
| Parameter output_end output_interval | Type C(:) | Default "" | Unit | ISO8601 time stamp for end of output. An example for this time stamp format is given below. More than one value is possible in order to define multiple start/end/interval triples. See namelist parameter output_bounds for an alternative specification of output events. ISO8601 time stamp for repeating output intervals. We choose the advection time step matching or following the requested output time, therefore we require output_bounds(3) > dtime. An example for this time stamp format is given below. More than one value is possible in order to | Scope |
| operation | C | None | | define multiple start/end/interval triples. See namelist parameter output_bounds for an alternative specification of output events. Use this variable for internal diagnostics applied on all given output variables or groups except time-constant ones: mean for | |
| | | | | generating time averaged, square for time averaged square values, max or min for maximum and minimum and acc for accumulated values within the corresponding interval, i.e. output_interval. Supported are 2D, 3D and single values like global means on model levels of all components. All operations can be used on global and nested grids. | |
| pe_placement_il | I(:) | -1 | | Advanced output option: Explicit assignment of output MPI ranks to the isentropic level output file. At most stream_partitions_il different ranks can be specified. See namelist parameter pe_placement_ml for further details. | |
| pe_placement_hl | I(:) | -1 | | Advanced output option: Explicit assignment of output MPI ranks to the height level output file. At most stream_partitions_hl different ranks can be specified. See namelist parameter pe_placement_ml for further details. | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------|------|-----------|------|---|---------|
| pe_placement_ml | I(:) | -1 | | Advanced output option: Explicit | |
| | | | | assignment of output MPI ranks to the | |
| | | | | model level output file. At most | |
| | | | | stream_partitions_ml different ranks can | |
| | | | | be specified, out of the following list: 0 | |
| | | | | (num_io_procs - 1). If this namelist | |
| | | | | parameters is not provided, then the output | |
| | | | | ranks are chosen in a Round-Robin fashion | |
| | | | | among those ranks that are not occupied by | |
| | | | | explicitly placed output files. | |
| pe_placement_pl | I(:) | -1 | | Advanced output option: Explicit | |
| | | | | assignment of output MPI ranks to the | |
| | | | | pressure level output file. At most | |
| | | | | stream_partitions_pl different ranks can | |
| | | | | be specified. See namelist parameter | |
| | | | | pe_placement_ml for further details. | |
| ready_file | C | "default" | | A ready file is a technique for handling | |
| | | | | dependencies between the NWP processes. | |
| | | | | The completion of the write process is | |
| | | | | signalled by creating a small file with name | |
| | | | | ready_file. Different output_nml's may be | |
| | | | | joined together to form a single ready file | |
| | | | | event. The setting of ready_file = | |
| | | | | "default" does not create a ready file. The | |
| | | | | ready file name may contain string tokens | |
| | | | | <pre><path>, <datetime>, <ddhhmmss>,</ddhhmmss></datetime></path></pre> | |
| | | | | <pre><datetime2> which are substituted as</datetime2></pre> | |
| | | | | described for the namelist parameter | |
| | | | | filename_format. | |
| reg_def_mode | I | 0 | | Specify if the "delta" value prescribes an | remap=1 |
| | | | | interval size or the total *number* of | |
| | | | | intervals: 0: switch automatically between | |
| | | | | increment and no. of grid points, 1: | |
| | | | | reg_lon/lat_def(2) specifies increment, 2: | |
| | | | | reg_lon/lat_def(2) specifies no. of grid | |
| | | | | points. | |
| remap | I | 0 | | interpolate horizontally | |
| | | | | 0: none | |
| , , | 7.75 | | | 1: to regular lat-lon grid | |
| north_pole | R(2) | 0,90 | | definition of north pole for rotated lon-lat | |
| | | | | grids ([longitude, latitude]. | |

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------------------|------|------------|------|---|---------|
| reg_lat_def | R(3) | None | | start, increment, end latitude in degrees. | remap=1 |
| | | | | Alternatively, the user may set the number | |
| | | | | of grid points instead of an increment. | |
| | | | | Details for the setting of regular grids is | |
| | | | | given below together with an example. | |
| reg lon def | R(3) | None | | The regular grid points are specified by three | remap=1 |
| | | | | values: start, increment, end given in | |
| | | | | degrees. Alternatively, the user may set the | |
| | | | | number of grid points instead of an | |
| | | | | increment. Details for the setting of regular | |
| | | | | grids is given below together with an | |
| | | | | example. | |
| steps per file | I | -1 | | Max number of output steps in one output | |
| | | | | file. If this number is reached, a new output | |
| | | | | file will be opened. Setting steps_per_file to | |
| | | | | 1 enforces a flush when writing is completed, | |
| | | | | so that the file is immediately accessible for | |
| | | | | reading. | |
| $steps_per_file_inclfirst$ | L | see descr. | | Defines if first step is counted wrt. | |
| | | | | steps_per_file files count. The default is | |
| | | | | .FALSE. for GRIB2 output, and .TRUE. | |
| | | | | otherwise. | |
| $stream_partitions_hl$ | I | 1 | | Splits height level output of this namelist | |
| | | | | into several concurrent alternating files. See | |
| | | | | namelist parameter stream_partitions_ml | |
| | | | | for details. | |
| $stream_partitions_il$ | I | 1 | | Splits isentropic level output of this namelist | |
| | | | | into several concurrent alternating files. See | |
| | | | | namelist parameter stream_partitions_ml | |
| | | | | for details. | |
| $stream_partitions_ml$ | I | 1 | | Splits model level output of this namelist | |
| | | | | into several concurrent alternating files. The | |
| | | | | output is split into N files, where the start | |
| | | | | date of part i gets an offset of | |
| | | | | $(i-1)*$ output_interval. The output | |
| | | | | interval is then replaced by | |
| | | | | $N*$ output_interval, the include_last | |
| | | | | flag is set to .FALSE., the | |
| | | | | steps_per_file_inclfirst flag is set to | |
| | | | | .FALSE., and the steps_per_file counter | |
| | | | | is set to 1. | |

| Parameter | Type | Default | Unit | Description | Scope | |
|----------------------|------|---------|------|---|-----------------------------|------|
| stream_partitions_pl | I | 1 | | Splits pressure level output of this namelist | | |
| | | | | into several concurrent alternating files. See namelist parameter stream_partitions_ml | | |
| | | | | for details. | | |
| ${ m rbf_scale}$ | R | -1. | | Explicit setting of RBF shape parameter for | interpol_nml:rbf_scale_mode | _ll: |
| | | | | interpolated lon-lat output. This namelist parameter is only active in combination with | | |
| | | | | interpol_nml:rbf_scale_mode_ll=3. | | |

Defined and used in: src/io/shared/mo_name_list_output_init.f90

Interpolation onto regular grids: Horizontal interpolation onto regular grids is possible through the namelist setting remap=1, where the mesh is defined by the parameters

- reg_lon_def: mesh latitudes in degrees,
- reg_lat_def: mesh longitudes in degrees,
- north_pole: definition of north pole for rotated lon-lat grids.

The regular grid points in reg_lon_def, reg_lat_def are each specified by three values, given in degrees: start, increment, end. The mesh then contains all grid points start + k * increment <= end, where k is an integer. Instead of defining an increment it is also possible to prescribe the number of grid points.

- Setting the namelist parameter reg_def_mode=0: Switch automatically from increment specification to no. of grid points, when the reg_lon/lat_def(2) value is larger than 5.0.
- 1: reg_lon/lat_def(2) specifies increment
- 2: reg_lon/lat_def(2) specifies no. of grid points

For longitude values the last grid point is omitted if the end point matches the start point, e.g. for 0 and 360 degrees.

${\bf Examples}$

local grid with 0.5 degree increment:

reg_lon_def = -30.,0.5,30. reg_lat_def = 90.,-0.5, -90.

global grid with 720x361 grid points:

reg_lon_def = 0.,720,360. reg_lat_def = -90.,360,90.

Time stamp format: The namelist parameters output_start, output_end, output_interval allow the specification of time stamps according to ISO 8601. The general format for time stamps is YYYY-MM-DDThh:mm:ss where Y: year, M: month, D: day for dates, and hh: hour, mm: minute, ss: second for time strings. The general format for durations is PnYnMnDTnHnMnS. See, for example, http://en.wikipedia.org/wiki/ISO_8601 for details and further specifications.

NOTE: as the mtime library underlaying the output driver currently has some restrictions concerning the specification of durations:

- 1. Any number n in PnYnMnDTnHnMnS must have two digits. For instance use "PT06H" instead of "PT6H"
- 2. In a duration string PnyearYnmonMndayDTnhrHnminMnsecS the numbers nxyz must not pass the carry over number to the next larger time unit: 0<=nmon<=12, 0<=nhr<=23, 0<=nmin<=59, 0<=nsec<=59.999. For instance use "P01D" instead of "PT01M" instead of "PT01M" instead of "PT00S".

Soon the formatting problem will be resolved and the valid number ranges will be enlarged. (2013-12-16).

Examples

```
date and time representation (output_start, output_end)
duration (output_interval)
```

2013-10-27T13:41:00Z POODTO6HOOMOOS

Variable Groups

Keyword "group:": Using the "group:" keyword for the namelist parameters ml_varlist, hl_varlist, pl_varlist, sets of common variables can be added to the output:

| • | |
|---|--|
| group:all | output of all variables (caution: do not combine with $\underline{\text{mixed}}$ vertical interpolation) |
| <pre>group:atmo_ml_vars</pre> | basic atmospheric variables on model levels |
| <pre>group:atmo_pl_vars</pre> | same set as atmo_ml_vars, but except pres |
| <pre>group:atmo_zl_vars</pre> | same set as atmo_ml_vars, but expect height |
| group:nh_prog_vars | additional prognostic variables of the nonhydrostatic model |
| <pre>group:atmo_derived_vars</pre> | derived atmospheric variables |
| group:rad_vars | |
| <pre>group:precip_vars</pre> | |
| <pre>group:cloud_diag</pre> | |
| <pre>group:pbl_vars</pre> | |
| <pre>group:phys_tendencies</pre> | |
| <pre>group:land_vars</pre> | |
| <pre>group:snow_vars</pre> | snow variables |
| <pre>group:multisnow_vars</pre> | multi-layer snow variables |
| <pre>group:additional_precip_vars</pre> | |
| group:dwd_fg_atm_vars | DWD first guess fields (atmosphere) |
| <pre>group:dwd_fg_sfc_vars</pre> | DWD first guess fields (surface/soil) |
| group:ART_AERO_VOLC | ART volcanic ash fields |
| group:ART_AERO_RADIO | ART radioactive tracer fields |
| group:ART_AERO_DUST | ART mineral dust aerosol fields |
| group:ART_AERO_SEAS | ART sea salt aerosol fields |
| <pre>group:prog_timemean</pre> | time mean output: temp, u, v, rho |
| <pre>group:tracer_timemean</pre> | time mean output: qv, qc, qi |
| <pre>group:echam_timemean</pre> | time mean output: most echam surface variables |
| <pre>group:atmo_timemean</pre> | time mean variables from prog_timemean, tracer_timemean, echam_timemean |
| | |

Keyword "tiles:": The "tiles:" keyword allows to add all tiles of a specific variable to the output, without the need to specify all tile fields separately. E.g. "tiles:t_g" (read: "tiles of t_g") automatically adds all t_g_t_X fields to the output. Here, X is a placeholder for the tile number. Make sure to specify the name of the aggregated variable rather than the name of the corresponding tile container (i.e. in the given example it must be t_g, and not t_g_t!).

Note:

There exists a special syntax which allows to remove variables from the output list, e. g. if these undesired variables were contained in a previously selected group.

Typing <varname>" (for example temp") removes the variable from the union set of group variables and other selected variables. Note that typos are not detected but that the corresponding variable is simply not removed!

Keyword substitution in output filename (filename_format):

path
output_filename
physdom
levtype
levtype_l
jfile
datetime
datetime2
datetime3
ddhhmmss
hhhmmss
npartitions
ifile_partition
total index

substituted by model base dir substituted by output filename substituted by physical patch ID substituted by level type "ML", "PL", "HL", "IL" like levtype, but in lower case substituted by output file counter substituted by ISO-8601 date-time stamp in format YYYY-MM-DDThh:mm:ss.sssZ substituted by ISO-8601 date-time stamp in format YYYYMMDDThhmmssZ substituted by ISO-8601 date-time stamp in format YYYYMMDDThhmmss.sssZ substituted by relative day-hour-minute-second string substituted by relative three-digit day-hour-minute-second string substituted by relative hour-minute-second string If namelist is split into concurrent files: number of stream partitions. If namelist is split into concurrent files: stream partition index of this file. If namelist is split into concurrent files: substituted by the file counter (like in jfile), which an ünsplit "namelist would have produced

2.37 parallel_nml

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------|----------|---------|------|---|---------------------------------------|
| nproma | I | 1 | | chunk length. | |
| $nblocks_c$ | I | 0 | | Number of looping chunks used for cells. For | |
| | | | | $values \le 0$ this is ignored. For bigger | |
| | | | | values, this overwrites nproma . | |
| n_ghost_rows | I | 1 | | number of halo cell rows | |
| division_method | I | 1 | | method of domain decomposition | |
| | | | | 0: read in from file | |
| | | | | 1: use built-in geometric subdivision | |
| division_file_name | C | | | Name of division file | $ division_method = 0 $ |
| ldiv_phys_dom | L | .TRUE. | | .TRUE.: split into physical domains before | $\operatorname{division_method} = 1$ |
| | | | | computing domain decomposition (in case of | |
| | | | | merged domains) | |
| | | | | (This reduces load imbalance; turning off | |
| | | | | this option is not recommended except for | |
| | | | | very small processor numbers) | |
| p_test_run | L | .FALSE. | | .TRUE. means verification run for MPI | |
| | 1 | | | parallelization (PE 0 processes full domain) | Thursday, and the second |
| num_test_pe | I | -1 | | If set to more than 1, use this many ranks for | $p_{test_run} = .TRUE.$ |
| | | | | testing and switch to different consistency | |
| | | | | test. This enables tests for identity in setups | |
| | | | | which are too big to run on a single rank but is limited to comparing one MPI | |
| | | | | parallelization setup vs. another, obviously. | |
| l test openmp | \mid L | .FALSE. | | if .TRUE. is combined with | p_test_run = .TRUE. |
| | | TALSE. | | p test run=.TRUE. and OpenMP | p_test_run = .freeE. |
| | | | | parallelization, the test PE gets only 1 | |
| | | | | thread in order to verify the OpenMP | |
| | | | | parallelization | |
| l_log_checks | L | .FALSE. | | if .TRUE. messages are generated during | |
| | | | | each synchonization step (use for debugging | |
| | | | | only) | |
| l_fast_sum | L | .FALSE. | | if .TRUE., use fast (not | |
| | | | | processor-configuration-invariant) global | |
| | | | | summation | |
| use_dycore_barrier | L | .FALSE. | | if .TRUE., set an MPI barrier at the | |
| | | | | beginning of the nonhydrostatic solver (do | |
| | | | | not use for production runs!) | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------------|------|---------|------|---|---|
| itype_exch_barrier | I | 0 | | 1: set an MPI barrier at the beginning of each MPI exchange call 2: set an MPI barrier after each MPI WAIT | |
| $iorder_sendrecv$ | I | 1 | | call 3: $1+2$ (do not use for production runs!) Sequence of send/receive calls: $1 = \text{irecv/send}$ | |
| default_comm- | I | 1 | | $egin{array}{ll} 2 = { m isend/recv} \ 3 = { m isend/irecv} \ { m Default\ implementation\ of} \end{array}$ | |
| _pattern_type | | | | $egin{array}{ll} { m mo_communication \ to \ be \ used:} \ 1 = { m original} \ 2 = { m YAXT} \end{array}$ | |
| itype_comm | I | 1 | | 1: use local memory for exchange buffers 3: asynchronous halo communication for dynamical core (currently deactivated) | |
| $\mathbf{num_io_procs}$ | I | 0 | | Number of I/O processors (running exclusively for doing I/O) | |
| num_io_procs_radar | I | 0 | | Number of dedicated I/O processors for the efficient radar forward operator EMVORADO. Choosing more I/O processors than the total number of simulated radar stations of all domains is not advisable, because one station is handled by one I/O processor. However, less I/O processors can be chosen, in which case one processor handles several stations. I/O tasks actually include much more than plain output for each station and can be very time consuming. More details can be found in the EMVORADO User's Guide available from the COSMO web page (www.cosmo-model.org \rightarrow Documentation \rightarrow EMVORADO) or from the emvorado submodule ./externals/emvorado/DOC/TEX/emvorado_If num_io_procs_radar=0, a subset of the worker processors (=number of radar stations) are doing the I/O tasks, which may slow down the model considerably. | <pre>luse_radarfwo(<idom>) =.TRUE., iequations=3, iforcing=3</idom></pre> |

| Parameter | Туре | Default | Unit | Description | Scope |
|---|------|---------|------|--|---------------------------|
| $num_restart_procs$ | I | 0 | | Number of restart processors (running | |
| | | | | exclusively for doing restart) | |
| ${f num_prefetch_proc}$ | I | 1 | | Number of processors for prefetching of | Mandatory for itype_latbc |
| | | | | boundary data asynchronously for a limited | = 1 |
| | | | | area run (running exclusively for reading | |
| | | | | Input boundary data. Maximum no of | |
| | | | | processors used for it is limited to 1). | |
| proc0_shift | I | 0 | | Number of processors at the beginning of the | |
| | | | | rank list that are excluded from the domain | |
| | | | | decomposition. Setting this parameter to 1 | |
| | | | | serves for offloading I/O to the vector hosts | |
| | | | | of the NEC Aurora, but it works technically | |
| | | | | on other platforms as well. | |
| use omp input | L | .FALSE. | | Setting this parameter to .TRUE. activates | |
| | | | | OpenMP sections in initicon that allow task | |
| | | | | parallelism for reading atmospheric input | |
| | | | | data, overlapping reading, sending, and | |
| | | | | statistics calculations. | |
| pio_type | I | 1 | | Type of parallel I/O. | |
| | | | | 1: Classical async I/O processors | |
| | | | | 2: CDI-PIO (Experimental!) Experimental! | |
| use icon comm | L | .FALSE. | | Enable the use of MPI bulk communication | |
| | | | | through the icon comm lib | |
| icon comm debug | L | .FALSE. | | Enable debug mode for the icon comm lib | |
| max send recv- | I | 131072 | | Size of the send/receive buffers for the | |
| _buffer_size | | | | icon comm lib. | |
| $\begin{array}{c} - \\ use_dp_mpi2io \end{array}$ | L | .FALSE. | | Enable this flag if output fields shall be | |
| | | | | gathered by the output processes in | |
| | | | | DOUBLE PRECISION. | |
| restart chunk size | I | 1 | | (Advanced namelist parameter:) Number of | |
| | | | | levels to be buffered by the asynchronous | |
| | | | | restart process. The (asynchronous) restart | |
| | | | | is capable of writing and communicating | |
| | | | | more than one 2D slice at once. | |
| num dist array replicas | I | 1 | | (Advanced namelist parameter:) Number of | |
| | | | | replicas of the distributed array used for the | |
| | | | | pre patch. | |
| io process stride | I | -1 | | (Advanced namelist parameter:) Stride of | |
| | | | | processes taking part in reading of data. | |
| | | | | (Few reading processes, i.e. a large stride, | |
| | | | | often gives best performance.) | |

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------|------|---------|------|--|-------|
| io_process_rotate | I | 0 | | (Advanced namelist parameter:) Rotate of processes taking part in reading of data. (Process taking part if p_pe_work % stride == rotate) | |

Defined and used in: src/namelists/mo_radiation_nml.f90

2.40 run_nml

| Parameter | Type | Default | Unit | Description | Scope |
|------------|------|---------|------|---|-------|
| nsteps | I | -999 | | Number of time steps of this run. Allowed | |
| | | | | range is ≥ 0 ; setting a value of 0 allows | |
| | | | | writing initial output (including internal | |
| | | | | remapping) without calculating time steps. | |
| dtime | R | 600.0 | s | time step. | |
| | | | | For real case runs the maximum allowable | |
| | | | | time step can be estimated as | |
| | | | | $1.8 \cdot \text{ndyn}$ _substeps $\cdot \overline{\Delta x} \text{s km}^{-1}$, | |
| | | | | where $\overline{\Delta x}$ is the average resolution in km | |
| | | | | and ndyn_substeps is the number of | |
| | | | | dynamics substeps set in | |
| | | | | nonhydrostatic_nml. ndyn_substeps should | |
| | | | | not be increased beyond the default value 5. | |
| ltestcase | | .TRUE. | | Idealized testcase runs | |
| ldynamics | L | .TRUE. | | Compute adiabatic dynamic tendencies | |
| iforcing | 1 | 0 | | Forcing of dynamics and transport by | |
| | | | | parameterized processes. Use positive indices | |
| | | | | for the atmosphere and negative indices for | |
| | | | | the ocean. | |
| | | | | 0: no forcing | |
| | | | | 1: Held-Suarez forcing | |
| | | | | 2: ECHAM forcing | |
| | | | | 3: NWP forcing | |
| | | | | 4: local diabatic forcing without physics | |
| | | | | 5: local diabatic forcing with physics | |
| 1 | | DALCE | | -1: MPIOM forcing (to be done) | |
| ltransport | L | .FALSE. | | Compute large-scale tracer transport | |
| ntracer | I | 0 | | Number of advected tracers handled by the | |
| | | | | large-scale transport scheme | |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------|--------|-----------------|------|---|----------------------|
| lvert_nest | L | .FALSE. | | If set to .true. vertical nesting is switched on | |
| | | | | (i.e. variable number of vertical levels) | |
| num_lev | I(max_ | 31 | | Number of full levels (atm.) for each domain | $lvert_nest=.TRUE.$ |
| | dom) | | | | |
| nshift | I(max_ | 0 | | vertical half level of parent domain which | $lvert_nest=.TRUE.$ |
| | dom) | | | coincides with upper boundary of the | |
| | | | | current domain required for vertical | |
| | | | | refinement, which is not yet implemented | |
| ltimer | L | .TRUE. | | TRUE: Timer for monitoring the runtime of | |
| | | | | specific routines is on $(FALSE = off)$ | |
| timers_level | I | 1 | | | |
| activate_sync_timers | L | F | | TRUE: Timer for monitoring runtime of | |
| | | | | communication routines (FALSE = off) | |
| ${f msg_level}$ | I | 10 | | controls how much printout is written during | |
| | | | | runtime. | |
| | | | | For values less than 5, only the time step is | |
| | | | | written. | |
| $msg_timestamp$ | L | .FALSE. | | If .TRUE., precede output messages by time | |
| | | | | stamp. | |
| debug_check_level | I | 0 | | Setting a value larger than 0 activates debug | |
| | | | | checks. | |
| output | C(:) | "nml", "totint" | | Main switch for enabling/disabling | |
| | | | | components of the model output. One or | |
| | | | | more choices can be set (as an array of | |
| | | | | string constants). Possible choices are: | |
| | | | | • "none": switch off all output; | |
| | | | | • "nml", now output mode (of | |
| | | | | • "nml": new output mode (cf. | |
| | | | | <pre>output_nml);</pre> | |
| | | | | • "totint": computation of total integrals. | |
| | | | | • "maxwinds": write max. winds to | |
| | | | | separate ASCII file "maxwinds.log". | |
| | | | | | |
| | | | | If the output namelist parameter is not set | |
| | | | | explicitly, the default setting "nml","totint" is | |
| | | | | assumed. | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------|------------|---------|------|--|-------|
| restart_filename | C | | | File name for restart/checkpoint files (containing keyword substitution patterns <gridfile>, <idom>, <rsttime>, <mtype>). default: "<gridfile>_restart_<mtype>_<rsttime>.</rsttime></mtype></gridfile></mtype></rsttime></idom></gridfile> | nc". |
| profiling_output | I | 1 | | controls how profiling printout is written: TIMER_MODE_AGGREGATED=1, TIMER_MODE_DETAILED=2, TIMER_MODE_WRITE_FILES=3. | |
| lart | L | .FALSE. | | Main switch which enables the treatment of atmospheric aerosol and trace gases (The ART package of KIT is needed for this purpose) | |
| ldass_lhn | L | .FALSE. | | Main switch which enables the assimilation of radar derived precipitation rate via Latent Heat Nudging | |
| check_uuid_gracefully | L | .FALSE. | | If this flag is set to .TRUE. we give only warnings for non-matching UUIDs. | |
| luse_radarfwo | L(max_dom) | .FALSE. | | For each domain, switch to activate the efficient volume scan radar forward operator EMVORADO. The EMVORADO code is provided as a submodule named emvorado, which is part of the ICON distribution. ICON itself contains only some ICON specific interface modules. ./configure (respectively the call to a configure wrapper script) needs the optionenable-emvorado. EMVORADO needs its own namelist(s) for each radar-active model domain in a separate namelist input file RADARSIM_PARAMS. More details can be found in the EMVORADO User's Guide available from the COSMO web page (www.cosmo-model.org → Documentation → EMVORADO) or from the submodule ./externals/emvorado/DOC/TEX/emvorado | |

| incigno | 10 | 10000 | | are flat | |
| lread smt | \mid L | .FALSE. | | read smoothed topography from file (TRUE) | |
| iicad_Siiit | | TALSE. | | or compute internally (FALSE) | |
| | | | | or compute internally (PALSE) | |

Defined and used in: src/namelists/mo_sleve_nml.f90

2.43 synsat nml¹

This namelist enables the RTTOV library incorporated into ICON for simulating satellite radiance and brightness temperatures. RTTOV is a radiative transfer model for nadir-viewing passive visible, infrared and microwave satellite radiometers, spectrometers and interferometers, see

https://nwpsaf.eu/deliverables/rtm

for detailed information.

| Parameter | Type | Default | Unit | Description | Scope |
|------------|----------|---------|------|---|-------|
| lsynsat | L | .FALSE. | | Main switch: Enables/disables computation | |
| | (max_dor | n) | | of synthetic satellite imagery for each model | |
| | | | | domain. | |
| nlev_rttov | I | 51 | | Number of RTTOV levels. | |

Enabling the synsat module makes the following 32 two-dimensional output fields available:

| SYNMSG_RAD_CL_IR3.9 | SYNMSG_BT_CL_IR3.9 | SYNMSG_RAD_CL_WV6.2 | SYNMSG_BT_CL_WV6.2 |
|----------------------|---------------------|----------------------|---------------------|
| SYNMSG_RAD_CL_WV7.3 | SYNMSG_BT_CL_WV7.3 | SYNMSG_RAD_CL_IR8.7 | SYNMSG_BT_CL_IR8.7 |
| SYNMSG_RAD_CL_IR9.7 | SYNMSG_BT_CL_IR9.7 | SYNMSG_RAD_CL_IR10.8 | SYNMSG_BT_CL_IR10.8 |
| SYNMSG_RAD_CL_IR12.1 | SYNMSG_BT_CL_IR12.1 | SYNMSG_RAD_CL_IR13.4 | SYNMSG_BT_CL_IR13.4 |
| SYNMSG_RAD_CS_IR3.9 | SYNMSG_BT_CS_IR3.9 | SYNMSG_RAD_CS_WV6.2 | SYNMSG_BT_CS_WV6.2 |
| SYNMSG_RAD_CS_WV7.3 | SYNMSG_BT_CS_WV7.3 | SYNMSG_RAD_CS_IR8.7 | SYNMSG_BT_CS_IR8.7 |
| SYNMSG_RAD_CS_IR9.7 | SYNMSG_BT_CS_IR9.7 | SYNMSG_RAD_CS_IR10.8 | SYNMSG_BT_CS_IR10.8 |
| SYNMSG_RAD_CS_IR12.1 | SYNMSG_BT_CS_IR12.1 | SYNMSG_RAD_CS_IR13.4 | SYNMSG_BT_CS_IR13.4 |

Here, RAD denotes radiance, BT brightness temperature, CL cloudy, and CS clear sky, supplemented by the channel name. Defined and used in: src/namelists/mo_synsat_nml.f90

2.44 synradar nml

The list of diagnostic output variables in ICON incorporates some fields related to synthetic radar reflectivity on the model grid:

- 'dbz', 'dbz_850', 'dbz_cmax', 'dbz_ctmax'
- 'echotop', 'echotopinm'

By default, these are based on a simple analytic so-called Rayleigh-approximation for single-particle backscattering.

If ICON is configured with the flag --enable-emvorado and compiled with the pre-processor flag -DHAVE_RADARFWO, some alternative, more accurate Mie- or T-matrix methods from the radar forward operator EMVORADO can be used by namelist choice (see below), particularly for improving the simulation of the so-called "bright band", the enhanced reflectivity in the melting layer.

EMVORADO is the Efficient Modular VOlume RADar Operator for simulating radar volume scans for cloud- and weather radar wavelenghts, see

¹Important note: This feature is currently active for configuration dwd+cray only.

- EMVORADO User's Guide in ICON's EMVORADO submodule ./externals/emvorado/DOC/TEX/emvorado_userguide.pdf or on the COSMO web page (www.cosmo-model.org → Documentation → EMVORADO) http://www.cosmo-model.org/content/model/documentation/core/emvorado_userguide.pdf
- A COSMO Technical Report No. 28 on the COSMO web page (www.cosmo-model.org → COSMO Tech Reports) http://www.cosmo-model.org/content/model/documentation/techReports/cosmo/docs/techReport28.pdf

for detailed information.

| Parameter | Type | Default | Unit | Description | Scope |
|---|----------------------|---------|------|---|-----------------------|
| synradar_meta | TYPE(dbzcalc_params) | | | Instance of the derived type | iforcing=3, |
| | | | | dbzcalc_params from EMVORADO to | ICON configure'd with |
| | | | | specify details of the radar reflectivity | enable-emvorado |
| This type contains: | | | | calculation for related outputs ('dbz', | |
| | | | | 'dbz_850', 'dbz_cmax', 'dbz_ctmax', | |
| $\operatorname{synradar} \underline{} \operatorname{meta} \% \operatorname{itype} \underline{} \operatorname{refl}$ | I | 4 | | 'echotop', 'echotopinm'). The type is | |
| | | | | documented in detail in the EMVORADO | |
| and many other parameters which | | | | User's Guide. | |
| are only relevant if itype_refl is | | | | The most important component is | |
| not the default (4) | | | | itype refl: | |
| | | | | 1: Mie-scattering from EMVORADO | |
| | | | | assuming spherical particles and including a | |
| | | | | detailed melting scheme for the radar "bright | |
| | | | | band". | |
| | | | | 3: Rayleigh-Oguchi approximation from | |
| | | | | EMVORADO including a simple melting | |
| | | | | scheme, but not producing pronounced | |
| | | | | "bright bands". | |
| | | | | 4: Traditional Rayleigh approximation from | |
| | | | | ICON, also without pronounced "bright | |
| | | | | bands". This is the default. | |
| | | | | 5: T-matrix scattering from EMVORADO | |
| | | | | assuming oblate spheroids, otherwise similar | |
| | | | | to Mie-option 1. | |
| | | | | 6: T-matrix scattering from EMVORADO | |
| | | | | assuming spherical particles, only for | |
| | | | | sanity-checks against Mie-option 1. | |
| | | | | For options 1, 5, 6 there are many more | |
| | | | | relevant type components. | |

Defined and used in: src/namelists/mo_synradar_nml.f90

2.45 time_nml

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|------|-------------------------------|-------|
| calendar | I | 1 | | Calendar type: | |
| | | | | 0=Julian/Gregorian | |
| | | | | 1=proleptic Gregorian | |
| | | | | 2=30day/month, 360 day/year | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------|------|---------------|------|--|-------|
| dt restart | R | 0. | S | Length of restart cycle in seconds. This | |
| _ | | | | namelist parameter specifies how long the | |
| | | | | model runs until it saves its state to a file | |
| | | | | and stops. Later, the model run can be | |
| | | | | resumed, s. t. a simulation over a long period | |
| | | | | of time can be split into a chain of restarted | |
| | | | | model runs. | |
| | | | | Note that the frequency of writing restart | |
| | | | | files is controlled by | |
| | | | | io_nml:dt_checkpoint. Only if the value of | |
| | | | | dt_checkpoint resulting from model default | |
| | | | | or user's specification is longer than | |
| | | | | dt_restart, it will be reset (by the model) | |
| | | | | to dt_restart so that at least one restart | |
| | | | | file is generated during the restart cycle. If | |
| | | | | dt_restart is larger than but not a multiple | |
| | | | | of dt_checkpoint, restart file will not be | |
| | | | | generated at the end of the restart cycle. | |
| ini_datetime_string | C | '2008- 09-01T | | Initial date and time of the simulation | |
| | | 00:00:00Z' | | | |
| end_datetime_string | C | '2008- 09-01T | | End date and time of the simulation | |
| | | 01:40:00Z' | | | |
| is_relative_time | L | .FALSE. | | .TRUE., if time loop shall start with step 0 | |
| | | | | regardless whether we are in a standard run | |
| | | | | or in a restarted run (which means | |
| | | | | re-initialized run). | |

Length of the run If "nsteps"n run_nml is positive, then nsteps*dtime is used to compute the end date and time of the run. Else the initial date and time, the end date and time, dt_restart, as well as the time step are used to compute "nsteps".

2.46 transport_nml (used if run_nml/ltransport=.TRUE.)

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------------|---------|------|---|--|
| lvadv_tracer | L | .TRUE. | | Main switch for vertical tracer transport. TRUE/FALSE: compute/do not compute vertical tracer advection. If vertical advection is switched off, the tracer mass fraction q is kept constant. | |
| ihadv_tracer | I(ntracer) | 2 | | Tracer specific method to compute horizontal advection: 0: no horiz. transport. The tracer mass fraction q is kept constant. 1: upwind (1st order) 2: Miura (2nd order, linear reconstr.) 3: Miura3 (quadr. or cubic reconstr.) 4: FFSL (quadr. or cubic reconstr.) 5: hybrid Miura3/FFSL (quadr. or cubic reconstr.) 20: miura (2nd order, lin. reconstr.) with subcycling 22: combination of miura and miura with subcycling 32: combination of miura3 and miura with subcycling 42: combination of FFSL and miura with subcycling 52: combination of hybrid FFSL/Miura3 with subcycling 52: combination of hybrid FFSL/Miura3 with subcycling Subcycling means that the integration from time step n to n+1 is splitted into substeps to meet the stability requirements. For NWP runs, substepping is generally applied above z = 22 km (see nonhydrostatic nml/hbot qvsubstep). | $\begin{array}{c} \operatorname{lsq_high_ord} \in [2,3] \\ \operatorname{lsq_high_ord} \in [2,3] \\ \operatorname{lsq_high_ord} \in [2,3] \end{array}$ |
| ivadv_tracer | I(ntracer) | 3 | | Tracer specific method to compute vertical advection: 0: no vert. transport. The tracer mass fraction q is kept constant. 1: upwind (1st order) 2: Parabolic Spline Method (PSM): allows for CFL > 1 | lvadv_tracer=TRUE |

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------|------------|--------------|--|---|---------------------------------------|
| | | | | 3: Piecewise parabolic method (PPM): | |
| | | | | allows for $CFL > 1$ | |
| itype hlimit | I(ntracer) | 4 | | Type of limiter for horizontal transport: | |

| expol_blending_scale | R | 10000 | m | Vertical distance above expol_start_height within which blending of linearly extrapolated state and climatological state takes place. | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------|------|---------|------|--|---|
| expol_vn_decay_scale | R | 10000 | m | Scale height of vertically exponentially decaying factor multiplied to the extrapolated horizontal wind (to alleviate stability-endangering wind magnitudes). | |
| expol_temp_infty | R | 400 | K | Exospheric mean reference temperature of the climatology for the extrapolation blending. | |
| lexpol_sanitycheck | L | .FALSE. | | .TRUE.: Apply some rudimentary sanity check to the extrapolated atmospheric state in the region above expol_start_height (e.g., temperature values everywhere > 0). (Please, apply with care, since it is computationally relatively expensive.) | |
| Upper-atmosphere physics | | | | | (iforcing = 2 (ECHAM) & "coming soon") or (iforcing = 3 (NWP) & lupatmo_phy = .TRUE.) |
| orbit_type | I | 1 | | Orbit model for upper-atmosphere radiation (compare echam_rad_nml: l_orbvsop87): 1: vsop87 → standard and accurate model 2: kepler → simple model appropriate for idealized work | |
| solvar_type | I | 1 | | Solar activity: 1: normal 2: low 3: high | |
| solvar_data | I | 2 | | Data set for solar activity: 1: G. Rottman data 2: J. Lean data | |
| solcyc_type | I | 2 | | Solar cycle: 1: standard cycle 2: 27-day cycle | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------------------|------------|---------|------|--|--------------------------------------|
| nwp_grp_ <groupname>%</groupname> | | | | Configuration of the upper-atmosphere process groups under NWP-forcing (compare time control of processes in echam_phy_nml): <groupname> = imf: ion drag, molecular diffusion and frictional heating <groupname> = rad: radiation and chemical heating</groupname></groupname> | iforcing = 3 lupatmo_phy = .TRUE. |
| imode | I(max_dom) | | | Group mode: 0: all processes clustered in the group <groupname> are switched off 1: all processes are switched on 2: all processes run in offline-mode, i.e. tendencies are computed, but not coupled to the dynamics Example of usage for multi-domain applications: • set nwp_grp_imf%imode = 1 to switch on the IMF-group for all domains (default) • set nwp_grp_rad%imode = 1,1,0 to switch on the RAD-group for domain 1 and 2, but to switch it off for domain 3 Please note: if imode = 1 or 2 for a domain, but lupatmo_phy = .FALSE. for this domain, imode is set to 0 and the group is switched off.</groupname> | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------------|--------------------------------------|------|--|-------|
| dt | R(max_dom) | $300.0 _{ m imf}, \ 600.0 _{ m rad}$ | S | Tendency update period. New tendencies from all processes of a group are computed every dt (temperature, wind and water vapor tendencies in case of IMF, and temperature tendencies in case of RAD). Please note: internal processing will round dt to the next multiple of the domain-adjusted value of run_nml: dtime, which in turn might have been rescaled, if grid_nml: grid_rescale_factor $\neq 1$. In case of a domain-wise assignment in a multi-domain application, $dt(1) \geq dt(2) \geq \dots$ is required. | |
| t_startt_end | C | 11 11 | | Tendencies from all processes of a group are computed within the time interval [t_start, t_end]. Outside this interval the tendencies are set to zero. Format as for time_nml: ini_datetime_string, e.g. nwp_grp_imf%t_start = "2008-09-01T00:00:00Z". Empty strings will be replaced by the simulation start and/or end date and time of the domain. t_start and t_end apply to all domains, no domain-wise specification possible! | |
| start_height | R | -999.0 | m | All processes of a group compute tendencies above start_height. Below start_height the processes are inactive and all tendencies are set to zero. A negative value means that the default start heights of each process, listed in src/upper_atmosphere/mo_upatmo_impl_costartHeightDef, are applied. Please note: start_height applies to all domains. If it is above the top of one domain, the group is switched off for that domain (imode(idom) is set to 0). | onst: |

| | | | | (Dinitrogen (N_2) is determined | |
| | | | | diagnostically.) | |
| imode | I | 2 | | Gas mode (comparable, but generally not | |
| | | | | identical to the irad_ <gasname> in</gasname> | |
| | | | | radiation_nml and echam_rad_nml). | |
| | | | | 0: zero gas concentration | |
| | | | | 1: constant gas concentration (independent | |
| | | | | of space and time), specified via | |
| | | | | $nwp_gas_\!<\!gasname\!>\!\%vmr$ | |
| | | | | 2: external data; meridionally, vertically and | |
| | | | | monthly varying gas concentrations are read | |
| | | | | from a file with name | |
| | | | | $nwp_extdat_gases\%filename$ | |
| vmr | R | 0.0 | m^3/m^3 | Constant volume mixing ratio for a | nwp gas <gasname>%imode</gasname> |
| VIIII | 16 | 0.0 | 111 / 111 | radiatively active gas. | $\lim_{n \to \infty} \frac{1}{2} \operatorname{gas}_{n} = 1$ |
| | | | | radiatively active gas. | |
| fscale | R | 1.0 | | Scaling factor the gas concentration in each | $\begin{array}{ c c c c c c c c c c c c c c c c c c c$ |
| Iscarc | 10 | 1.0 | | grid cell is multiplied with. | |
| nwp extdat <extdatname>%</extdatname> | | | | Configuration of the external | $\begin{array}{c ccccccccccccccccccccccccccccccccccc$ |
| mwp_extuat_\extuathame>/0 | | | | upper-atmosphere data: | mwb_grb_rad/0mmode > 0 |
| | | | | <pre><extdatname> = gases: concentrations of</extdatname></pre> | |
| | | | | the radiatively active gases | |
| | | | | <pre><extdatname> = chemheat: temperature</extdatname></pre> | |
| | | | | tendencies from chemical heating | |
| | | | | Please note: the standard NWP physics use | |
| | | | | other external gas data (e.g., for ozone)! | |
| | | | | outer experimal gas data (e.g., for ozone): | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|----------------------------|------|---|-------|
| dt | R | 86400.0 | S | Update period for the time interpolation of the external data. Currently, the external data provide monthly mean values. In order to avoid too strong jumps in the transition from one month to the next, the parameters are "smoothed" in time by a linear interpolation that is computed every dt. A value of the order of a day should be entirely sufficient for this purpose. | |
| filename | C | "upatmo_gases_chemheat.nc" | | Name of the file containing the external data. The file of the default name can be found in the folder data/, to which a link has to be set in the run script, following the typical examples of nwp_phy_nml: lrtm_filename and cldopt_filename. May contain the keyword <path> which will be substituted by model_base_dir (e.g., "<path> upatmo_gases_chemheat.nc"). Please note: if you would like to use other external data files, their data structure has to follow exactly the data structure of data/upatmo_gases_chemheat.nc (variable and dimension names and units, zonally averaged monthly mean gas concentrations on pressure levels, zonally averaged monthly mean temperature tendencies from chemical heating on geometric height levels etc.). Any other structure cannot be processed for the time being!</path></path> | |

Defined and used in: src/namelists/mo_upatmo_nml.f90

Some notes on the output of upper-atmosphere-specific variables (under NWP-forcing):

An output of upper-atmosphere fields is only possible, if upper-atmosphere physics are switched on. Upper-atmosphere fields cannot be output in the GRIB format (output_nml: filetype = 2). Upper-atmosphere fields entered on output_nml: $m/h/pl_varlist$ need the prefix "upatmo_".

The following fields can be output, if ...

```
\dots lupatmo phy = .TRUE.:
                                                           Mass of dry air
upatmo_mdry
                                                           Molar mass of dry air
upatmo_amd

3 Ocean-specific namelist parameters

3.1 ocean_physics_nml

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------|------|---------|------|-----------------------------------|-------|
| i_sea_ice | I | 1 | | 0: No sea ice, 1: Include sea ice | |
| | | | | .FALSE.: compute drag only | |
| richardson_factor_tracer | I | 0.5e-5 | m/s | | |
| richardson_factor_veloc | I | 0.5e-5 | m/s | | |
| l_constant_mixing | L | .FALSE. | · | | |

3.2 sea_ice_nml (relevant if run_nml/iforcing=2 (ECHAM))

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------|---------|------|--|---------------------------|
| i_ice_therm | I | 2 | | Switch for thermodynamic model: | In an ocean run i_sea_ice |
| | | | | 1: Zero-layer model | must be $>=1$. In an |
| | | | | 2: Two layer Winton (2000) model | atmospheric run the ice |
| | | | | 3: Zero-layer model with analytical forcing | surface type must be |
| | | | | (for diagnostics) | defined. |
| | | | | 4: Zero-layer model for atmosphere-only runs | |
| | | | | (for diagnostics) | |
| i_ice_dyn | I | 0 | | Switch for sea-ice dynamics: | |
| | | | | 0: No dynamics | |
| | | | | 1: FEM dynamics (from AWI) | |
| i_ice_albedo | I | 1 | | Switch for albedo model. Only one is | |
| | | | | implemented so far. | |
| i_Qio_type | I | 2 | | Switch for ice-ocean heat-flux calculation | Defaults to 1 when |
| | | | | method: | i_ice_dyn=0 and 2 |
| | | | | 1: Proportional to ocean cell thickness (like | otherwise. |
| | | | | MPI-OM) | |
| | | | | 2: Proportional to speed difference between | |
| | | | | ice and ocean | |
| kice | I | 1 | | Number of ice classes (must be one for now) | |
| hnull | R | 0.5 | m | Hibler's h_0 parameter for new-ice growth. | |
| hmin | R | 0.05 | m | Minimum sea-ice thickness allowed. | |
| ramp_wind | R | 10 | days | Number of days it takes the wind to reach | |
| | | | | correct strength. Only used at the start of an | |
| | | | | OMIP/NCEP simulation (not after restart). | |

4 Namelist parameters for testcases (NAMELIST_ICON)

The ICON model code includes several experiments, so-called test cases, for the 2 and 3-dimensional atmosphere. Depending on the specified experiment, initial conditions and boundary conditions are computed internally.

4.1 nh_testcase_nml (Scope: ltestcase=.TRUE. and iequations=3 in run_nml)

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------|---------|------|--|---------------------------|
| nh_test_name | С | 'jabw' | | testcase selection | |
| | | | | 'zero': no orography | |
| | | | | 'bell': bell shaped mountain at 0E,0N | |
| | | | | 'schaer': hilly mountain at 0E,0N | $is_plane_torus=.TRUE.$ |
| | | | | 'jabw': Initializes the full Jablonowski | |
| | | | | Williamson test case. | |
| | | | | ' jabw s': Initializes the Jablonowski | |
| | | | | Williamson steady state test case. | |
| | | | | ' jabw m': Initializes the Jablonowski | |
| | | | | Williamson test case with a mountain | |
| | | | | instead of the wind perturbation (specify | |
| | | | | mount_height). | |
| | | | | 'mrw nh': Initializes the full | |
| | | | | Mountain-induced Rossby wave test case. | |
| | | | | 'mrw2 nh': Initializes the modified | |
| | | | | mountain-induced Rossby wave test case. | |
| | | | | 'mwbr const': Initializes the mountain | |
| | | | | wave with two layers test case. The lower | |
| | | | | layer is isothermal and the upper layer has | |
| | | | | constant brunt vaisala frequency. The | |
| | | | | interface has constant pressure. | |
| | | | | ' PA ': Initializes the pure advection test case. | |
| | | | | 'HS nh': Initializes the Held-Suarez test | |
| | | | | case. At the moment with an isothermal | |
| | | | | atmosphere at rest (T=300K, ps=1000hPa, | |
| | | | | u=v=0, topography=0.0). | |
| | | | | 'HS jw': Initializes the Held-Suarez test | |
| | | | | case with Jablonowski Williamson initial | |
| | | | | conditions and zero topography. | |
| | | | | 'APE nwp, APE echam, APE nh, | |
| | | | | APEc nh, ': Initializes the APE | |
| | | | | experiments. With the jabw test case, | |
| | | | | including moisture. | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|------|--|------------------------------|
| | | | | 'wk82': Initializes the Weisman Klemp test | $l_{limited_area} = .TRUE.$ |
| | | | | case | |
| | | | | 'g lim area': Initializes a series of general | |
| | | | | limited area test cases: itype atmos ana | |
| | | | | determines the atmospheric profile, | |
| | | | | itype anaprof uv determines the wind | |
| | | | | profile and itype topo ana determines the | |
| | | | | topography | |
| | | | | 'dcmip bw 11': Initializes (moist) | |
| | | | | baroclinic instability/wave (DCMIP2016) | |
| | | | | 'dcmip pa 12': Initializes Hadley-like | |
| | | | | meridional circulation pure advection test | |
| | | | | case. | |
| | | | | 'dcmip rest 200': atmosphere at rest test | lcoriolis = .FALSE. |
| | | | | (Schaer-type mountain) | 199119115 |
| | | | | 'dcmip mw 2x': nonhydrostatic | lcoriolis = .FALSE. |
| | | | | mountain waves triggered by Schaer-type | loonens intest. |
| | | | | mountain waves unggered by sender type | |
| | | | | 'dcmip gw 31': nonhydrostatic gravity | |
| | | | | waves triggered by a localized perturbation | |
| | | | | (nonlinear) | |
| | | | | 'dcmip gw 32': nonhydrostatic gravity | l limited area = .TRUE. |
| | | | | waves triggered by a localized perturbation | and lcoriolis = .FALSE. |
| | | | | (linear) | and reorions — .Triese. |
| | | | | 'dcmip tc 51': tropical cyclone test case | lcoriolis = .TRUE. |
| | | | | with 'simple physics' parameterizations (not | |
| | | | | yet implemented) | |
| | | | | 'dcmip tc 52': tropical cyclone test case | lcoriolis = .TRUE. |
| | | | | with with full physics in Aqua-planet mode | reorions = . Tree E. |
| | | | | 'CBL': convective boundary layer | is plane torus=.TRUE |
| | | | | simulations for LES package on torus | is_plane_tolus—.TROE |
| | | | | (doubly periodic) grid | |
| | | | | 'bb13': linear gravity- and sound-wave | is plane torus— TDIIE |
| | | | | | is_plane_torus= .TRUE. |
| | | | | expansion in a channel (Baldauf, Brdar | |
| | | | | (2013) QJRMS) | |

| Parameter | Type | Default | Unit | Description | Scope |
|---|-----------|--|--------------------------------------|---|---|
| is_toy_chem tracer_inidist_list | L I(:) | .FALSE. | | 'lahade': deep-atmosphere sound wave testcase providing comparison of numerical with analytical solution according to method of Laeuter, Handorf and Dethloff, J. Comp. Phys.(2005) (requires to set src/shared/mo_physical_constants: grav to a very small value, e.g. grav = 1.0E-30) 'SCM' Single Column Mode Terminator toy chemistry activated when .TRUE. For a subset of testcases pre-defined initial tracer distributions are available. This namelist parameter specifies the initial distribution for each tracer. In the following the testcases and the pre-defined numbers are given: 'PA': 4,5,6,7,8 'JABW':1,2,3,4 'DF': 5,6,7,8,9 For more details on the initial distributions, please have a look into the code. | Ideepatmo = .TRUEAND. Icoriolis = .TRUEAND. Icentrifugal = .TRUE. |
| dcmip bw% | | | | DCMIP2016 baroclinic wave test | 'dcmip_bw_11' |
| deep | I | 0 | | deep atmosphere | |
| moist | I | 0 | | (1 = yes or 0 = no) include moisture, i.e. $qv \neq 0$ (1 = yes or 0 = no) type of initial perturbation | |
| r | | | | (0 = exponential, 1 = stream function) | |
| toy_chem% | • | · | · | terminator toy chemistry | is_toy_chem=.TRUE. |

6 Serialization

Some developments must not change model results. Serialbox allows reading and writing data at any point in ICON into savepoints. These savepoints can be used to restore model variables to some reference or compare different model versions. The simplest application of Serialbox is using mo_ser_debug.f90 (or writing a similar routine fitting ones needs). Following this method will allow reading and writing manually specified fields in ICON. This can be very useful for small subroutines where input and output are clearly specified (i.e. do not involve derived types) and can thus easily be translated to Serialbox read/write statements. For larger components (basically everything hanging from nh_stepping.f90, e.g. nwp_physics) the interface is specified by the in and out types. The actual fields that are read or written to in these subroutines are not specified. For this purpose, serialize_all has been implemented. It provides a wrapper for Serialbox read and write statements by looping through variable lists. This approach does not require managing lists of fields to read or write by Serialbox. At the level of

mo_nh_stepping.f90 and mo_nh_interface_nwp.f90 many components are wrapped by such serialize_all calls that allow testing these components. Each of these hard-coded calls to serialize_all has a name and for each name there is a namelist switch specifying the following triplet (e.g. 0,12,12):

- If 0 do not use this savepoint, else use this savepoint at every time step
- the relative threshold for errors (given as N for N in 10^{-N})
- the absolute threshold for errors (given as N for N in 10^{-N})

Defined and used in: src/namelists/mo_ser_nml.f90

7 External packages

8 Information on vertical level distribution

If no vertical sleve coordinate is chosen (ivctype / =2), the hydrostatic and nonhydrostatic models need hybrid vertical level information to generate the terrain following coordinates. The hybrid level specification is stored in <icon home>/hyb_params/HYB_PARAMS_<nlev>. The hydrostatic model assumes to get pressure based coordinates, the nonhydrostatic model expects height based coordinates. For further information see <icon home>/hyb_params/README.

9 Compile flag for mixed precision

To speed up code parts strongly limited by memory bandwidth (primarily the dynamical core and the tracer advection), an option exists to use single precision for variables that are presumed to be insensitive to computational accuracy. This affects most local arrays in the dynamical core routines (solve_nonhydro and velocity_advection), some local arrays in the tracer transport routines, the metrics coefficients, arrays used for storing tendencies or differenced fields (gradients, divergence etc.), reference atmosphere fields, and interpolation coefficients. Prognostic variables and intermediate variables affecting the accuracy of mass conservation are still treated in double precision. To activate the mixed-precision option, run the configure script with the '--enable-mixed-precision' flag.

A Arithmetic expression evaluation

The mo_expression module evaluates basic arithmetic expressions specified by character-strings. It is possible to include mathematical functions, operators, and constants. An application of this module is the evaluation of arithmetic expressions povided as namelist parameters.

Besides, Fortran variables can be linked to the expression and used in the evaluation. The implementation supports scalar input variables as well as 2D and 3D fields.

From a users' point of view, the basic usage of this module is described in Section A.1 below. Technically, infix expressions are processed based on a Finite State Machine (FSM) and Dijkstra's shunting yard algorithm. A more detailed described of the Fortran interface is given in Section A.3.

A.1 Examples for arithmetic expressions

Basic examples:

- fgrt(2.0)"
- fin(45*pi/180.) * 10 + 5"
- if(1. > 2, 99, -1.*pi)"
- "min(1,2)"

Variables are used with a bracket notation:

• "sqrt([u]^2 + [v]^2)"

Note that the use of variables requires that these are enabled ("linked") by the Fortran routine that calls the mo_expression module.

A.2 Expression syntax

A.2.1 List of functions

| name | $\# { m args}$ | description |
|-----------------------|----------------|---|
| log(), exp() | 1 | natural logarithm and its inverse function. |
| sin(), cos() | 1 | trigonometric functions |
| sqrt() | 1 | square root |
| erf() | 1 | Gauss error function |
| min(), max() | 2 | minimum and maximum of two values |
| if(value, then, else) | 3 | conditional expression $(value > 0.)$ |

A.2.2 List of operators

| name | evaluates to | | | |
|---|--|--|--|--|
| $ \begin{array}{cccccccccccccccccccccccccccccccccccc$ | $(a+b), (a-b), (a*b), (a/b)$ a^b | | | |
| a > b | $\begin{cases} 1, & \text{if } a > b, \\ 0, & \text{otherwise.} \end{cases}$ | | | |
| a < b | $\begin{cases} 1, & \text{if } a < b, \\ 0, & \text{otherwise.} \end{cases}$ | | | |

A.2.3 List of available constants

| name of constant | assigned value | description |
|------------------|-----------------------|--|
| pi | 4 atan(1) | mathematical constant equal to a circle's cir- |
| | | cumference divided by its diameter |
| r | $6.371229 \cdot 10^6$ | $Earth's radius^1$ |

A.3 Usage with Fortran

The minimal Fortran interface is as follows:

- 1. The TYPE expression which is initialized with the character-string that specifies the arithmetic expression.
- 2. The type-bound procedure evaluate(), which returns the result (scalar or array-shaped) as a POINTER.
- 3. The type-bound procedure link() connecting a variable to a name in the character-string expression.

A.3.1 Fortran examples

The following examples illustrate the arithmetic expression parser. The calls to DEALLOCATE the data structures have been ommitted for the sake of brevity:

1. Scalar arithmetic expression:

```
formula = expression("sin(45*pi/180.) * 10 + 5")
CALL formula%evaluate(val)
... use "val" for some purpose ...
```

2. Masking of a 2D array as an example for the link procedure:

```
formula = expression("if([z_sfc] > 2., [z_sfc], 0.)")
CALL formula%link("z_sfc", z_sfc)
CALL formula%evaluate(val_2D)
  ... use "val_2D(:,:)" for some purpose ...
```

A.3.2 Error handling

Invalid arithmetic expressions yield ëmptyëxpression objects. When these are evaluated, a NULL() pointer is returned. A successful expression evaluation can be tested with the err_no variable:

```
IF (formula%err_no == ERR_NONE) THEN
END IF
```

In case of error, the err_no variable also provides the reason for the aborted evaluation process.

A.4 Remarks

- Variable names are treated case-sensitive!
- For 3D array input it is implicitly assumed that 2D fields are embedded in 3D fields as "3D(:,level,:) = 2D(:,:)".

B Changes incompatible with former versions of the model code

var names map file, out varnames map file Change: Date of Change: 2013-04-25 12016Revision:

- Renamed var names map file \rightarrow output nml dict.
- ullet Renamed out varnames map file \to netcdf dict.
- The dictionary in netcdf dict is now reversed, s.t. the same map file as in output nml dict can be used to translate variable names to the ICON internal names and back.

Change: output nml: namespace

2013-04-26 Date of Change:

Revision: 12051

¹This number seems to be based on Hayford's 1910 estimate of the Earth. It is used in ICON as well as MPAS and was almost certainly taken from the Jablonowski and Williamson test case (QJRMS, 2006).

• Removed obsolete namelist variable namespace from output nml.

Change: gribout nml: generatingCenter, generatingSubcenter

Date of Change: 2013-04-26

Revision: 12051

- Introduced new namelist variables generatingCenter and generatingSubcenter.
- If not set explicitly, center and subcenter information is copied from the input grid file

Change: radiation nml: albedo type

 Date of Change:
 2013-05-03

 Revision:
 12118

- Introduced new namelist variable albedo type
- If set to 2, the surface albedo will be based on the MODIS data set.

Change: initicon nml: dwdinc filename

 Date of Change:
 2013-05-24

 Revision:
 12266

• Renamed dwdinc filename to dwdana filename

Change: initicon_nml: l_ana_sfc

 Date of Change:
 2013-06-25

 Revision:
 12582

- \bullet Introduced new namelist flag **l** ana sfc
- If true, soil/surface analysis fields are read from the analysis fiel dwdfg_filename. If false, surface analysis fields are not read. Soil and surface are initialized with the first guess instead.

Change: new nwp phy tend list: output names consistent with variable names

Date of Change: $201\overline{3}-06-2\overline{5}$

Revision: 12590

 \bullet temp tend radlw \rightarrow ddt temp radlw

• temp tend $turb \rightarrow ddt$ temp turb

• temp tend $drag \rightarrow ddt$ temp drag

Change: prepicon nml, remap nml, input field nml

 Date of Change:
 2013-06-25

 Revision:
 12597

• Removed the sources for the "prepicon"binary!

• The "prepicon" functionality (and most of its code) has become part of the ICON tools.

Change: initicon_nml
Date of Change: 2013-08-19
Revision: 13311

• The number of vertical input levels is now read from file. The namelist parameter **nlev** in has become obsolete in r12700 and has been removed.

 $egin{array}{ll} {\it Change:} & {\it parallel_nml} \\ {\it Date of Change:} & {\it 2013-10-14} \\ {\it Revision:} & {\it 14160} \\ \hline \end{array}$

• The namelist parameter exch_msgsize has been removed together with the option iorder_sendrecv=4.

 $\begin{array}{ll} {\it Change:} & {\it parallel_nml} \\ {\it Date of Change:} & {\it 2013-08-14} \\ {\it Revision:} & {\it 14164} \end{array}$

• The namelist parameter use _sp_output has been replaced by an equivalent switch use _dp_mpi2io (with an inverse meaning, i.e. we have use _dp_mpi2io = .NOT. use _sp_output).

 Change:
 parallel_nml

 Date of Change:
 2013-08-15

 Revision:
 14175

• The above-mentioned namelist parameter **use_dp_mpi2io** got the default .FALSE. By this, the output data are sent now in single precision to the output processes.

Change: initicon nml: l ana sfc

 Date of Change:
 2013-10-21

 Revision:
 14280

• The above-mentioned namelist parameter l_ana_sfc has been replaced by lread_ana. The default is set to .TRUE., meaning that analysis fields are required and read on default. With lread_ana=.FALSE. ICON is able to start from first guess fields only.

Change: output nml: lwrite ready, ready directory

Date of Change: $2013-\overline{10}-25$

Revision: 14391

- The namelist parameters lwrite_ready and ready_directory have been replaced by a single namelist parameter ready_file, where ready_file /= 'default' enables writing ready files.
- Different output_nml's may be joined together to form a single ready file event they share the same ready_file.

Change: output nml: output bounds

 $\begin{array}{ll} \textit{Date of Change:} & \textbf{2013-10-25} \\ \textit{Revision:} & \textbf{14391} \end{array}$

• The namelist parameter **output bounds** specifies a start, end, and increment of output invervals. It does no longer allow multiple triples.

Change: output_nml: steps_per_file

 Date of Change:
 2013-10-30

 Revision:
 14422

• The default value of the namelist parameter steps per file has been changed to -1.

 $egin{array}{lll} {\it Change:} & {\it run_nml} \\ {\it Date of Change:} & {\it 2013-11-13} \\ {\it Revision:} & {\it 14759} \\ \hline \end{array}$

- The dump/restore functionality for domain decompositions and interpolation coefficients has been removed from the model code. This means, that the parameters
 - ldump_states,
 - lrestore_states,
 - ldump_dd,
 - lread dd.
 - nproc_dd,
 - dd_filename,
 - dump_filename.
 - l_one_file_per_patch

have been removed together with the corresponding functionality from the ICON model code.

Change:output_nml: filename_formatDate of Change:2013-12-02

 Date of Change:
 2013-12-02

 Revision:
 15068

• The string token <ddhhmmss> is now substituted by the *relative* day-hour-minute-second string, whereas the absolute date-time stamp can be inserted using <datetime>.

Change: output_nml: ready_file
Date of Change: 2013-12-03

 Date of Change:
 2013-12-03

 Revision:
 15081

• The ready file name has been changed and may now contain string tokens <path>, <datetime>, <ddhhmmss> which are substituted as described for the namelist parameter filename_format.

Change: interpl nml: rbf vec scale ll

 Date of Change:
 2013-12-06

 Revision:
 15156

- \bullet The real-valued namelist parameter ${\tt rbf_vec_scale_ll}$ has been removed.
- Now, there exists a new integer-valued namelist parameter, rbf_scale_mode_ll which specifies the mode, how the RBF shape parameter is determined for lon-lat interpolation.

 $egin{array}{lll} {\it Change:} & & {\it io_nml} \\ {\it Date of Change:} & & {\it 2013-12-06} \\ {\it Revision:} & & {\it 15161} \\ \hline \end{array}$

• Removed remaining vlist-related namelist parameter. This means that the parameters

- out filetype
- out_expname
- dt_data
- dt file
- lwrite_dblprec, lwrite_decomposition, lwrite_vorticity, lwrite_divergence, lwrite_pres, lwrite_tracer, lwrite_tracer, lwrite_tend_phy, lwrite_radiation, lwrite_precip, lwrite_cloud, lwrite_tke, lwrite_surface, lwrite_omega, lwrite_initial, lwrite_oce_timestepping

are no longer available.

 $\begin{array}{ll} \textit{Change:} & \textit{gridref_nml} \\ \textit{Date of Change:} & \textbf{2014-01-07} \\ \textit{Revision:} & \textbf{15436} \end{array}$

• Changed namelist defaults for nesting: grf_intmethod_e, 1_mass_consvcorr, 1_density_nudging.

 $\begin{array}{ll} \textit{Change:} & \text{interpol_nml} \\ \textit{Date of Change:} & 2014\text{-}02\text{-}10 \\ \textit{Revision:} & 16047 \end{array}$

• Changed namelist default for rbf_scale_mode_11: The RBF scale factor for lat-lon interpolation is now determined automatically by default.

Change: echam_phy_nml
Date of Change: 2014-02-27

Revision: 16313

• Replace the logical switch lcover by the integer switch icover that is used in ECHAM-6.2. Values are transferred as follows: .FALSE. = 1 (=default), .TRUE. = 2.

 $\begin{array}{ll} {\it Change:} & {\it turbdiff_nml} \\ {\it Date of Change:} & {\it 2014-03-12} \\ {\it Revision:} & {\it 16527} \end{array}$

• Change constant minimum vertical diffusion coefficients to variable ones proportional to $1/\sqrt{Ri}$ for inwp_turb = 10; at the same time the defaults for tkhmin and tkmmin are increased from $0.2 \,\mathrm{m}^2/\mathrm{s}$ to $0.75 \,\mathrm{m}^2/\mathrm{s}$.

 Change:
 nwp_phy_nml

 Date of Change:
 2014-03-13

 Revision:
 16560

• Removed namelist parameter dt_ccov, since practically it had no effect. For the quasi-operational NWP-setup, the calling frequency of the cloud cover scheme is the same as that of the convection scheme. I.e. both are synchronized.

 Change:
 nwp_phy_nml

 Date of Change:
 2014-03-24

 Revision:
 16668

• Changed namelist default for **itype z0**: use land cover related roughness only (itype_z0=2).

Change: nonhydrostatic nml

 Date of Change:
 2014-05-16

 Revision:
 17293

• Removed switch for vertical TKE advection in the dynamical core (lvadv_tke). TKE advection has been moved into the transport scheme and can be activated with iadv_tke=1 in the transport nml.

Change: nonhydrostatic nml

 Date of Change:
 2014-05-27

 Revision:
 17492

• Removed namelist parameter model_restart_info_filename in namelist master_model_nml.

 $\begin{array}{ll} {\it Change:} & {\it transport_nml} \\ {\it Date~of~Change:} & {\it 2014-06-05} \\ {\it Revision:} & {\it 17654} \end{array}$

• Changed namelist default for itype_hlimit from monotonous limiter (3) to positive definite limiter (4).

Change: nh_pzlev_nml
Date of Change: 2014-08-28
Revision: 18795

• Removed namelist nh_pzlev_nml. Instead, each output namelist specifies its separate list of p_levels, h_levels, and i_levels.

Change: nonhydrostatic nml

 Date of Change:
 2014-10-27

 Revision:
 19670

• Removed namelist parameter l_nest_rcf in namelist nonhydrostatic_nml.

Change: nonhydrostatic nml

 Date of Change:
 2014-11-24

 Revision:
 20073

• Removed namelist parameter iadv_rcf in namelist nonhydrostatic_nml. The number of dynamics substeps per advective step are now specified via ndyn_substeps. The meaning of run_nml:dtime has changed and denotes the advective time step.

 Change:
 io_nml

 Date of Change:
 2015-03-25

 Revision:
 21501

• Namelist parameter lzaxis_reference is deprecated and has no effect anymore. However, users are not forced to modify their scripts instantaneously: lzaxis_reference=.FALSE. is still a valid namelist setting, but it has no effect and a warning will be issued. lzaxis_reference finally removed in r24606.

 Change:
 limarea_nml

 Date of Change:
 2016-02-08

 Revision:
 26390

• Namelist parameter dt_latbc has been removed. Its value is now identical to the namelist parameter dtime_latbc.

 $\begin{array}{ll} {\it Change:} & {\it interpol_nml} \\ {\it Date of Change:} & {\it 2016-02-11} \\ {\it Revision:} & {\it 26423} \end{array}$

• Namelist parameter l_intp_c2l is deprecated and has no effect anymore.

 Change:
 lnd_nml

 Date of Change:
 2016-07-21

 Revision:
 28536

• The numbering of the various options for sstice_mode has changed. Former option 2 became 3, former option 3 became 4, and former option 4 became 5. This was necessary, because a new option was introduced (option 2).

Change: initicon_nml
Date of Change: 2016-07-22
Revision: 28556

• Namelist parameter latbc_varnames_map_file has been moved to the namelist limarea_nml.

 $\begin{array}{ll} \textit{Change:} & \text{transport_nml} \\ \textit{Date of Change:} & \textbf{2016-09-22} \\ \textit{Revision:} & \textbf{29339} \end{array}$

• Namelist parameter niter_fct has been removed, since the functionality of iterative flux correction is no longer available.

Change: initicon_nml
Date of Change: 2016-10-07
Revision: 29484

• Namelist parameter 1_sst_in has been removed. In case of init_mode=2 (IFSINIT), sea points are now initialized with SST, if provided in the input file. Otherwise sea points are initialized with the skin temperature. The possibility to use the skin temperature despite having the SST available has been dropped.

Change: initicon_nml
Date of Change: 2016-12-14

Revision: 62288ed77b2975182204a2ec6fa210a3fb1ad8a7

• Namelist parameters ana_varlist, ana_varlist_n2 have been renamed to check_ana(jg)%list, with jg indicating the patch ID.

Change:initicon_nmlDate of Change:2017-01-27Revision:ae1be66f

• The default value of the namelist parameter num_prefetch_proc has been changed to 1, i.e. asynchronous read-in of lateral boundary data is now enabled.

 $\begin{array}{ll} \textit{Change:} & \text{interpol_nml} \\ \textit{Date of Change:} & 2017\text{-}01\text{-}31 \\ \textit{Revision:} & \text{e1c56104} \end{array}$

• With the introduction of the namelist parameter lreduced_nestbdry_stencil in the namelist interpol_nml the nest boundary points are no longer removed from lat-lon interpolation stencil by default.

 $egin{array}{lll} {\it Change:} & & {\it limarea_nml} \\ {\it Date of Change:} & & {\it 2017-03-14} \\ {\it Revision:} & & {\it 631b731627} \\ \hline \end{array}$

• The namelist parameter nlev_latbc is now deprecated. Information about the vertical level number is taken directly from the input file.

Change: echam_phy_nml / mpi_phy_nml

Date of Change: 2017-04-19

Revision: icon-aes:icon-aes-mag 9ecee54f69108716308029d8d7aa0296c343a3c2

• The namelist echam_phy_nml is replaced by the namelist mpi_phy_nml, which extends the control to multiple domains and introduces time control in terms of start and end date/time [sd_prc,ed_prc] and time interval dt_prc for individual atmospheric processes prc.

Change: mpi phy nml / echam phy nml and mpi sso nml / echam sso nml

Date of Change: $201\overline{7}$ -11- $2\overline{2}$

Revision: icon-aes:icon-aes-cfgnml f84219511329281d441d81923fe97ce1d7ecf007

• The namelists, configuration variables and related modules are renamed from ...mpi_phy... to ...echam_phy... because programmers felt that the acronym "mpi"for "Max Planck Institute"in relation to physics cannot be distinguished from "mpi"for "Message Passing Interface used in the parallelization.

Change: gw hines nml / echam gwd nml

Date of Change: 2017-11-24

Revision: icon-aes:icon-aes-cfgnml 699346b5d318d53be215e0b8e8b5ba8631d44c48

• The namelists gw_hines_nml is replaced by the namelist echam_gwd_nml, which extends the control to multiple domains.

Change: vdiff nml / echam vdf nml

Date of Change: 2017-11-27

 ${\color{red}Revision:} \qquad \text{icon-aes:icon-aes-cfgnml } 11 \text{dec} 0 \text{a} 0 \text{d} 3 \text{b} 8 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{a} 729 \text{fe} 43 \text{fd} 68 \text{ec} 506861975 \text{cd} 59 \text{ec} 506861975 \text{ec} 506861975 \text{cd} 59 \text{ec} 506861975 \text{$

• The namelists vdiff_nml is replaced by the namelist echam_vdf_nml, which additionally includes tuning parameters for the total turbulent energy scheme, and extends the control to multiple domains.

Change: echam conv nml / echam cnv nml

Date of Change: 2017-11-29

Revision: icon-aes:icon-aes-cfgnml 099c40f88dbaae6c7cc79ea878e5862847ef7e27

• The namelists echam_conv_nml is replaced by the namelist echam_cnv_nml, which extends the control to multiple domains.

Change: echam cloud nml / echam cld nml

Date of Change: $2017-1\overline{2}-04$

Revision: icon-aes:icon-aes-cfgnml afacc102a87b03f78ff47ad0b7af8f348bacef6f

• The namelists echam cloud nml is replaced by the namelist echam cld nml, which extends the control to multiple domains.

Change: psrad orbit nml / radiation nml / echam rad nml

Date of Change: 2017-12-12

Revision: icon-aes:icon-aes-cfgnml 8da087238b81183c337a3b1ae81d2b2e3dafdba8

• For controlling the input of ECHAM physics to the PSrad scheme, the namelists psrad_orbit_nml and radiation_nml are replaced by the namelist echam_rad_nml, which extends the control to multiple domains. For controlling the input of NWP physics to the RRTMG radiation, the radiation_nml namelist remains valid. The psrad_orbit_nml namelist, which is not used for RRTMG radiation, is deleted.

Change: echam cld nml / echam cov nml

Date of Change: 2019-06-07

Revision: icon-aes-cover 09233f275f207d59d2cb6ad75bd13adf81c0d0c2

• The control parameters for the cloud cover parameterization (crs, crt, nex, jbmin, jbmax, cinv, csatsc) are shifted to the new namelist echam cov nml.

Change: echam cov nml / echam cov nml

Date of Change: 2019-06-12

Revision: icon-aes:icon-aes-cover 419e7ed54faa6db86a7151ece33b8e0b24737129 and e66e8e0f9cd439b81d7db63e0a4e03004d7f8144

- The control parameters jks, jbmin and jbmax, specifying heights by the index of the vertical grid, are replaced by parameters zcovmax, zinvmax, and zinvmin, respectively, which directly specify the heights of interest. The change is as follows:
 - jks=15 -> zmaxcov=echam phy config%zmaxcloudy
 - jbmin=43 -> zmaxinv=2000m
 - jbmax=45 -> zmininv=300m

Change: echam cld nml / echam cld nml

Date of Change: $2019-0\overline{6}-12$

 $\frac{Revision}{Revision}: icon-aes: icon-aes: icon-aes-cover \ ab 95 fc 16a 944 dde 96a 76a eb 1f6 3a 7c8 47d 78d a06 \ and \ e66e 8e 0f9 cd 43 9b 81d 7db 63e 0a 4e 0300 4d 7f8 144$

- The control parameters jks, specifying height by the index of the vertical grid, is replaced by the parameters zcldmax, which directly specify the height of interest. The change is as follows:
 - jks=15 -> zmaxcld=echam_phy_config%zmaxcloudy

Change: extpar_nml
Date of Change: 2019-11-29

Revision: icon-nwp:icon-nwp-dev 21a16daf65aaf8df6fb581daa7dca66e2c915b94

• The logical namelist parameter 1_emiss has been replaced by the integer parameter itype_lwemiss. The code executed by default does not change.

 $\begin{array}{ll} \textit{Change:} & \text{transport_nml} \\ \textit{Date of Change:} & \textbf{2020-06-17} \end{array}$

Revision: icon-nwp:icon-nwp-dev 616b4698e3a59c641a5ebe90637da2841c6f6a3a

• The logical namelist parameter 1strang has been deleted. The default behaviour of the code is unchanged.

Change: extpar_nml
Date of Change: 2021-02-01

Revision: icon-nwp:icon-nwp-dev ebac2edb0

• The functionality of itype_vegetation_cycle=3 has been replaced by setting the new namelist parameter icpl_da_sfcevap in initicon_nml to a value of 1.

Change: ha_dyn_nml / ha_testcase_nml

Date of Change: $20\overline{2}1-03-\overline{2}9$

Revision: icon-nwp:icon-nwp-dev 599f03e5

• The namelists for configuring the hydrostatic model ha_dyn_nml as well as the hydrostatic testcases ha_testcase_nml have been removed completely, as the hydrostatic model is no longer part of the official code.

Change: dynamics_nml
Date of Change: 2021-03-30

Revision: icon-nwp:icon-nwp-dev 959fb5db

- iequations=0,1,2 (shallow water and hydrostatic atmosphere $(T \text{ or } \theta \cdot dp))$ no longer supported.
- removed obsolete Namelist parameter sw_ref_height (reference height of shallow water model)

Change: diffusion_nml
Date of Change: 2021-04-16

Revision: icon-nwp-icon-nwp-dev 806be7b0

- removed obsolete Namelist parameter k2_pres_max and k2_klev_max, which were specific to the hydrostatic dynamical core.
- removed horizontal diffusion options hdiff_order=24,42
